Of still deeper interest and importance were his scientific researches. In these he aspired to detect the secrets of nature; he succeeded in seeing, as in a vision, the great scheme of evolution applied to all phenomena of the natural and moral world, which the labours of many workers have revealed to us in our own day. He longed for time and leisure to perfect these ideas, to base them on solid fact. Goethe has not added much of positive value to the treasury of scientific truth, but he deserves the credit of having discerned the right method of inquiry when it was obscure to many, and of having thrown that glow of imagination over dry and technical inquiry, without which no great discoveries can be made. His inquiries into the nature of light belong to a later time. He began with physiognomy under the auspices of Lavater. From this he was led to the study of anatomy, and especially to the comparison of the skeletons of men and animals. In this department he made a real discovery, that the intermaxillary bone which exists in the lower animals is found in the human subject in a rudimen-

tary state,—that it is seen distinctly in youth, but as years advance is united with the body of the skull. The discovery that the skull itself is only a development of the vertebræ of the spine was made a little later. He was led to this further step by picking up the head of a sheep on the shore of the Lido at Venice. The care of his garden cottage naturally led him to the study of plants. He soon found himself attracted to wide and comprehensive generalizations. The *Metamorphoses of Plants* was not published till 1790, but the idea which had possession of his mind was a solid contribution to the science of botany. Goethe sought to discover an original or standard flower, from which, as from a Platonic ideal type, all existing flowers were deflexions and aberrations. In this he followed an unscientific method, but he clearly saw that all the different parts of the plant, except the stem and the root, might be regarded as modifications of the leaf; that leaf, calyx, corolla, bud, pistil, and stamen were all referable to the same type; and that whether a plant produced leaves, or flowers, or fruit, depended on the differentiation of the nutrition which it received. Less fortunate were his speculations in geology, to which he devoted a very large portion of his time and thoughts. It is something that he recognized the importance and reality of that science, then in its infancy, which has had to undergo more than its due share of obloquy and distrust. But he was of necessity a follower of Werner, who based his classification of rocks rather on the minerals which they contained than upon an examination of the fossil remains of organic life. All these causes contributed together to one end. His desire to complete the great poetical works which he had begun, to disentangle his life from the complexities which had entwined themselves round it, to give a fair trial to his impulses towards art, to afford opportunity for the careful and systematic interrogation of nature, and, above all, a longing to possess his soul in peace, and solemnly to probe in silence the depths of his own being, conspired together to drive him from Weimar to the land which he had yearned after from boyhood. The resolution, slowly formed, was boldly executed. In the summer of 1785 he had visited Carlsbad for the first time, passed a pleasant month in the company of the duchess Louise, Herder, and Frau von Stein. In July 1786 he paid it a second visit. After five weeks of brilliant society, very favourable to his health, spent in revising his works for the press, he stole secretly away. The duke alone knew that he designed an absence of some duration. In the strictest incognito, in the guise of a German merchant, he drove alone to the land of the citron and the orange.

Italy. Goethe's Italian journey, the most momentous epoch in the development of his intellectual life, lasted from September 3, 1786, to June 18, 1788. Assuming the common German name of Müller, in the strictest incognito he journeyed by way of Munich, where he studied the picture gallery and the collection of antiquities; by the Lake of Garda, where he began his metrical version of the *Iphigenie*; by Verona, where he saw the first specimen of Roman building in Italy in the stupendous amphitheatre; by Vicenza, where he was attracted by the grace and harmony of the classical Palladio; by Padua, where he neglected the frescos of Giotto, but rose to a clear conception of the form of the *original plant* by the marks on the leaves of a palm in the botanical garden; to Venice, where for the first time he was able to taste the charm and richness of southern life. As he proceeded farther, Ferrara spoke to him of Tasso; Bologna showed him the great masters of the academic school who have now grown pale and dim before the predecessors of Raphael; Florence interested him a little; Assisi drew his attention, not to the triple church of Saint Francis, the unrivalled museum of religious art, but to the little ruined temple which no modern traveller would notice but for the

name of Goethe; Spoleto again delighted him with the remains of ancient architecture. He reached Rome on October 28. His first stay was till February. The constant companion of his studies was the painter Tischbein, who helped him to disentangle the many difficulties of the old Rome and the new. He lived chiefly among the German artists and men of letters who frequented the Caffè Greco. Among these were Angelica Kaufmann and Moritz, who deepened his knowledge of German versification, and prepared him for the composition of *Iphigenia*. Although Goethe occupied himself chiefly with drawing, he was able to announce on June 6 that this work was finished. The second *Iphigenie*, written in verse, was the first important fruit of the Italian journey. It is in very strong contrast with *Götz von Berlichingen*. It is written in the strictest classical form. Although based on the *Iphigenia in Tauris* of Euripides, it has little in common with it. In Euripides Thoas is represented as a cruel barbarian, against whom it is justifiable to employ every artifice of fraud or violence. In Goethe the characters are ennobled by a higher principle, and the struggle between truth and falsehood is made a prominent motive of the piece. When Thoas discovers that, according to the oracle of Apollo, the return of Orestes's sister to Greece will satisfy the anger of the gods, he gives his consent, and his last words are a friendly farewell. Towards the end of February Goethe left Rome for Naples. Here he was attracted less by the remains of antiquity, even the new revelations of Herculaneum and Pompeii, than by the prospects of nature, the bay, the islands, the volcano, the thousand beauties which make the gulf unrivalled in the world, and by the multitudinous and teeming life which throngs the endless quays that line the shore. Sorrento stimulated him to the revisal of *Torquato Tasso*, but he did not complete the drama till his return from Italy. It did not appear in print till the spring of 1790. The play had a special fascination for him as a picture of his own distracted life. He could depict with feeling the struggle between the actual and the ideal, the ill-assortment of a passionate poet with the jealous and artificial environment of a court. At the end of March Goethe sailed to Sicily; Sicily rolled up in his cloak he meditated the composition of his *Tasso*. Sicily struck him, as it must strike all travellers who have studied the ancient world, as a revelation of Greece. It is, if one may say so, more Greek than Greece itself. Its mountains, streams, trees, flowers, the form of its boats and pottery, the habits of the people, the quivering smile of the bright blue sea fringed with golden sand, represent completely the Greece of the *Odyssey* and of the choruses of Euripides. Goethe was overmastered by this powerful influence. He sketched and began *Nausicaa*, the story of the *Odyssey* in dramatic form, which always remained a fragment. He returned to Rome in June. The rest of the year was spent in the city and its neighbourhood, in the serious study of drawing, for which unfortunately he had but little talent, and in the composition of *Egmont*, a work begun with the approval of his father in the early Frankfort days. It was finished in September 1787, and appeared in the Easter of the following year. Although *Egmont* still keeps the stage, it has very grave faults. It is an unfortunate mixture of the natural and ideal treatment. The licence with which the scenes are transposed in modern performance shows how much the work lacks symmetry and cohesion. Schiller criticized it severely as being untrue to history. He described the close, where all difficulties are solved by the appearance of Clärchen, as a *deus ex machina* or a *salto mortale* into the world of opera. The music of Beethoven has contributed to it a charm of art which was necessary to its completeness. Besides this, Goethe rewrote for publication his early vaudevilles of *Erwin und Elmire* and *Claudine von Villa Bella*. The carnival of 1788 was of importance to his

experience. He wrote some scenes of *Faust*: especially the scene in the witches' kitchen was composed in the Borghese gardens. At the end of April he took a sad farewell of Italy, and arrived at Weimar in the middle of June.

Return to  
Weimar.

From this time his life takes a new colour. He had learned in Italy not only new principles of art,—not only that a work of art, whatever of Gothic ornament it may possess, must be solid, firm, and simple in its construction as a Grecian temple,—but he had also learned that life itself should be a work of art. He was determined henceforth to be himself, to break the bonds which had confined him and the distractions which had confused him, to possess his soul sacred and inviolable for the purposes of his life. He was relieved of the presidency of the chamber and of the war commission, but in a manner which did him the greatest honour. His relations with Frau von Stein, which had been one reason of his leaving Weimar, began to cool. One of their last friendly meetings was in a journey to Rudolstadt, where Goethe met Schiller. Neither knew the influence which the other would have upon his life. Their relations were those of shyness, and partly even of dislike. Goethe's friendship with Frau von Stein was to receive a final blow. In the autumn of 1788, walking aimlessly through the park, he met Christiane Vulpius, a young girl who presented him with a petition in favour of her brother. She had golden curling locks, round cheeks, laughing eyes, a neatly rounded figure; she looked, as has been said, "like a young Dionysus." Goethe took her into his house, and she became his wife in conscience, and the mother of his children. He did not marry her till 1806, when the terrors of the French occupation made him anxious for the position of his eldest son. She had but little education, and he could not take her into society; but she made him a good and loving wife, and her quick mother-wit made her available as an intellectual companion. To these days of early married life belong the Roman elegies, which, although Italian and pagan in form, in colour, and in sensuality, were written in Germany from home experiences.

Christiane  
Vulpius.

Cam-  
paigus.

We must pass rapidly over the next six years, until Goethe's genius received a new impulse and direction by his friendship with Schiller. In the spring of 1790 he travelled to Venice to meet the duchess Amalia. The Venetian epigrams, still more outspoken in sensuality than the Roman, were the fruit of this journey. In the autumn of the same year he accompanied the duke to Silesia, the first of those military journeys which strike so discordant a note in the harmonious tenor of his existence. The year 1791 offered a quiet contrast to the movement of the year before. He began to take a more special interest in the university at Jena, in which his young friend Fritz von Stein had now entered as a student, and his time was more and more occupied with the study of colours, the least happy and successful of his scientific labours. In the autumn of 1791 Goethe was able to devote himself regularly to a task which had informally occupied his first years in Weimar. The new theatre was completed, and Goethe was made director of it. It was in this capacity that he was best known to the citizens of Weimar. He had the final decision on every detail of piece, scenery, and acting; in later years his seat was in a large arm-chair in the middle of the pit, and applause was scarcely permitted until he gave the signal for it. The German stage owes perhaps as much to Goethe as to Lessing. The *répertoire* of the Weimar theatre was stocked with pieces of solid merit which long held their place. Shakespeare was seriously performed, and the actors were instructed in the delivery of blank verse. Stress was laid on the excellence of the *ensemble* as against the predominance of particular stars. The theatre was considered as a school not only of elevating

amusement but of national culture. Goethe wrote the *Gross Cophta* for the Weimar stage, a piece founded on the history of Cagliostro and the diamond necklace. He was fascinated by the story as a foreboding of the coming horrors of the Revolution. In these events he was destined to take a more active part than he expected. In August 1792 he accompanied the duke to the campaign in the Ardennes. Passing by Frankfort, where he visited his mother, he joined the allied armies at Longwy. He beguiled the tedious siege of Verdun by writing an account of his theory of colours in a leaky tent; and on the disastrous day of Valmy, which he recognized as the birth of a new era, he sought the thickest of the fight that he might experience the dangerous rapture of the cannon-fever. He retreated with the Prussian army, spent five weeks with his friend Jacobi at Pempelfort, and on his return to Weimar at the end of the year found that the duke had built him a spacious house in the square where the joint statues of Goethe and Schiller now stand, in eternal memory of their friendship. In 1793 he went with his master to the siege of Mainz. He continued his optical studies during the bombardment, witnessed the marching out of the garrison, and was one of the first to enter the conquered town. He received leave to withdraw, and went to his mother at Frankfort, and persuaded her to sell the old house and its contents, and to provide a more convenient home for her old age. There was some talk of her coming to Weimar. In the autumn of this year the duke left the Prussian service, and Goethe could look forward to a period of peace. He was chiefly occupied with the management of the theatre, and for this he wrote two pieces, both of which had reference to the politics of the time. The *Bürgergeneral* is a satire on the Revolution, and was long a stone of offence to Goethe's friends, who thought that he should have hailed with delight the birth of a new era. The *Aufgeregten*, left unfinished, sketched the outbreak of the Revolution in a country town, and would have declared the author's views with greater distinctness. But the feelings of scorn and contempt which he felt for the cowardice, cunning, and perfidy of mankind were expressed in a work of greater magnitude. He had good reason to deplore the misery of the time. His mother's home in Frankfort was broken up; Schlosser, his brother-in-law, had retired to Auerbach; Jacobi was flying to Holstein. Goethe took the old German epic of *Reynard the Fox*, with which he had long been familiar, and which, under the guise of animals, represents the conflicting passions of men, and rewrote it in flowing German hexameters.

Thus far he had produced but little since his return from Italy. He was now to undergo the most powerful influence which had as yet affected his life. His friendship with Schiller was now to begin, an alliance which, in the closeness of its intimacy and its deep effect on the character of both friends, has scarcely a parallel in literary history. If Schiller was not at this time at the height of his reputation, he had written many of the works which have made his name famous. He was ten years younger than Goethe. The *Räuber* plays the same part in his literary history as *Götz* plays in that of Goethe. This had been followed by *Fiesco* and *Kabale und Liebe*. The second period of Schiller's life had begun with his friendship with Körner, and his residence in Saxony. Here he wrote the *Hymn of Joy*, and completed *Don Carlos*. In 1787 he settled at Weimar. He found the place deserted, the duke in the Prussian camp, Goethe in Italy. He applied himself to history, wrote the *Revolt of the Netherlands*, and studied the literature and art of Greece. In 1789, mainly upon Goethe's recommendation, he was made professor of history at the university of Jena, although he was afraid lest the scholars should discover that they knew more history than the teacher.

Friend-  
ship with  
Schiller.

He made a successful marriage, and worked seriously at his *History of the Thirty Years' War*. In 1794 Schiller had arranged with the publisher, Cotta of Augsburg, whose name is from this time indissolubly connected with the history of German literature, for the production of a new literary journal. It was to be called the *Horen*, and the most distinguished German writers were to contribute to it. Goethe accepted the invitation willingly. The work was designed to mark an epoch in German taste, and it did so. It soon had two thousand subscribers. Among those who promised to contribute were not only Matthiſson, Herder, Knebel, Fritz Jacobi, and Gleim, but the brothers Humboldt, the veteran Kant, the youthful Fichte, who had just begun to lecture in Jena, and, at a later period, the brothers Schlegel. Schiller opened the first number of the journal with his letters on the "Æsthetic Education of the Human Race." Goethe contributed the "Unterhaltungen deutscher Ausgewanderten," a series of stories told by a number of German emigrants who had been driven to cross the Rhine by the invasion of the French. The most remarkable of these stories is the "Märchen," a wild and mystic tale, which has been the subject of as much controversy and of as many interpretations as the second part of *Faust*. Goethe also published in the *Horen* the "Römische Elegien," the flavour of which even Karl August found a little too strong. The first effect of Schiller's influence on Goethe was the completion of *Wilhelm Meisters Lehrjahre*. He had conceived the plan of the work twenty years before, and the first six books had been written before the Italian journey. It was now finished by the addition of two more books. It stands in the first rank of Goethe's writings. He has aimed in it to attain to perfect objectivity of tone, to represent men as they are, and to pass no judgment upon them. The hero passes with weak irresolution through a number of ordinary circumstances, apparently the sport of fortune and the playing of chance, yet all these experiences have their definite result in the training of his character. Like the son of Kish, he goes forth to seek his father's asses and finds a kingdom. The unearthly charm of the child Mignon, the dark fate which shrouds the aged harper like the doom of Œdipus, the uncertain yearning after a happier home in brighter climes, give a deeper undertone to the prevailing lightness of the story. The style is exquisitely soft and flowing. It has the sweetness and simplicity of *Werther*, but is more mellow and more mature. The sixth book is occupied with the *Bekenntnisse einer schönen Seele*, a piece of the autobiography of Goethe's early friend Fräulein von Klettenberg, altered to suit its new surroundings. The *Musen Almanach* for 1796, edited by Schiller, was enriched by some of Goethe's most exquisite poems—*Die Nahe des Geliebten*, *Meeres Stille*, and *Glückliche Fahrt*. The storm of criticism which was aroused by the *Horen*, and the little success which, after the first numbers, it met with from the public, determined the two friends to retaliate upon their aggressors. The poems of Martial contain a number of epigrams written in two lines, describing the numberless little presents or *venia*, which it was customary for friends to exchange at Rome during the time of the Saturnalia.

*Xenien*: The name was borrowed by the two poets, and the *Xenien* was a convenient vehicle for the expression of their opinion on every subject. The newspapers of the day were the first object of attack, but they soon went farther afield. The epigrams were written in Schiller's rooms at Jena. It is impossible to fix the authorship of the *Xenien*; one conceived the idea, the other wrote the lines; one wrote the hexameter, the other the pentameter; they intended the authorship as well as the ownership of the copyright to be one and indivisible. Notwithstanding this, the collection has been broken up. There is no guarantee that the epigrams which appear in the separate works of either poet were really

written by the authors to whom they are ascribed; some are reprinted in the works of both; some have remained unprinted altogether. They appeared in the *Musen Almanach* for 1797, together with the Venetian elegies mentioned above. It is needless to say that they roused the writers whom they attacked to unspeakable fury, and were the occasion of a copious literature. A more solid result of the friendship between the poets was the production of *Hermann Hermann und Dorothea*. It is a German idyll; the story is taken from the sufferings of Lutherans driven out in the early part of the 18th century from the province of Salzburg, but Goethe has given it the character of his own time. He had seen much of the suffering produced by the French Revolution, and he wished this poem to be a reflexion in a tiny mirror of the storms and convulsions of the great world. In its literary form it is a descendant of Voss's *Luiſe*. It was conceived at Ilmenau in August 1796, and finished in the following spring. Schiller tells us how it was composed with extraordinary ease and rapidity. During nine days Goethe produced 150 lines a day. You have only to shake the tree, as Schiller said, and ripe apples will tumble down about you. The lines thus hastily written underwent a careful revision. Contemporaneous with *Hermann und Dorothea* is the production of *Wallensteins Lager* by Schiller, which was written with the advice and assistance of his brother poet. The completion of this cycle of plays falls two years later.

The year 1797 is the year of ballads. In his garden house at Jena Schiller worked diligently at this vein, that perhaps for which he was best suited, and in which he most nearly rivals Goethe. Goethe wrote *Die Braut von Korinth*, *Gott und die Bayadere*, and *Der Zauberlehrling*; and the whole collection was published in the *Musen Almanach* for 1798. The latter half of this year was occupied with a tour in Switzerland. Before its commencement he visited his mother at Frankfurt for the last time, and presented to her his wife and his son. It was a year of extraordinary activity. Besides the ballads and his researches in the morphology of plants and insects, he translated a great part of the autobiography of Benvenuto Cellini, wrote a number of essays on the question of æsthetics, and worked at his long neglected *Faust*. Of this he wrote the dedication, the "Prologue in Heaven," and the "Golden Marriage of Oberon and Titania"—so powerful was the effect of intellectual sympathy and stimulus. The six years which succeeded Goethe's return from his third Swiss tour, although they embrace the period in which he and Schiller were in daily co-operation, have left us little of permanent worth from the older poet. On the other hand, they are the years of Schiller's greatest activity. The great trilogy of *Wallenstein*, perhaps the highest point of Schiller's genius, was followed by *Maria Stuart*, the *Jungfrau von Orleans*, the *Braut von Messina*, and *Wilhelm Tell*. From the end of 1799 Schiller was permanently settled in Weimar; a dramatic school was founded, and the representation of these classical dramas was the glory of the Weimar stage. During these years Goethe was occupied with *Faust*, with his researches into the theory of colours and of biological development, with the conduct of the theatre and the practical encouragement of art. In 1798 the *Horen* died a natural death, and was succeeded by the *Propylæen*, a journal of literature and criticism, which, although it contained many essays by Goethe, never exceeded a circulation of 300. In the spring of 1799 the study of Homer incited Goethe to sketch a long epic poem on the subject of Achilles. Schiller did his best to encourage the work. The first canto was rapidly completed, but it had no successor. Goethe contented himself with translating the works of others, and prepared the *Mahomet* and *Tancred* of Voltaire for the Leipsic stage. In the first

days of the new century he suffered a dangerous attack of scarlatina. His friends feared for his life. Frau von Stein recalled her forgotten friendship, and showed kindness to his son. After his recovery he sketched out what was the most important work of these years, a trilogy on the subject of the French Revolution; of this only the first part, the *Naturliche Tochter*, was completed. The story was a true one of a princess of the French house of Conti. The play is written with the full beauty of Goethe's style, and some passages and effects are worthy of his highest genius. But as a whole it fails. It has the quality, which in a drama must be a fault, so characteristic of Goethe's later writing, of too great universality of treatment. The characters are not living beings but abstractions, and the language is vague and general rather than clear and defined. The play was performed at Weimar on April 2, 1803. Two masterpieces of Schiller—the *Braut von Messina* and the *Jungfrau von Orleans*—preceded and followed it by a few weeks. At the end of this year Madame de Stael

Madame  
de Stael.

arrived in Weimar accompanied by Benjamin Constant. She had heard of the fame of this new Parnassus, and she was bent on proclaiming the intellectual superiority of Germany to the world. Goethe at first fled from her, as Byron did at a later period. He hid himself in Jena, but was recalled by order of the duke. The result of the conversations in the salons of Weimar is contained in her book *De l'Allemagne*. In March she was suddenly recalled by the death of her father, the minister Necker. Goethe was at this time the centre to which the most distinguished men of all kinds in Germany naturally turned. He was most intimate with Zelter the musician, with whom he maintained a full correspondence; with Wilhelm von Humboldt, the statesman-scholar; with F. A. Wolf, the founder of the science of philology; with Gottfried Hermann, the best authority on Greek metres. But the friendship which was worth all these was soon to be severed. In the beginning of 1805 Goethe was convinced that either he or Schiller would die in that year. In January they were both seized with illness; Schiller had finished his *Phædra* and begun to work at his *Demetrius*. Goethe was translating the *Neveu de Rameau* of Diderot. Schiller was the first to recover, and visiting Goethe in his sick room, fell on his neck and kissed him with intense emotion. On April 29 they saw each other for the last time. Schiller was on his way to the theatre whither Goethe was too ill to accompany him. They parted at the door of Schiller's house. Schiller died on the evening of the 9th of May. No one dared to tell Goethe the sad news, but he saw in the faces of those who surrounded him that Schiller must be very ill. On the morrow of Schiller's death, when his wife entered his room, he said, "Is it not true that Schiller was very ill yesterday?" She began to sob. He then cried, "He is dead!" "Thou hast spoken it thyself," she answered. Once more he cried, "He is dead!" and turning aside covered his weeping eyes with his hands. He at first intended to have completed *Demetrius* as a memorial of his friend, but a happier inspiration was to arrange a performance of Schiller's great poem of *The Bell*, and to crown it by an epilogue. Since that time Schiller and Goethe have been inseparable in the minds of their countrymen, and have reigned as twin stars in the literary firmament. If Schiller does not hold the first place, it is at least true that he is more beloved, although Goethe may be more admired. It would be invidious to separate them. But it is evident that the best fruits of Schiller's muse were produced when he was most closely under Goethe's influence, and the foreign student of German culture has ground for believing that at some future time the glory of the lesser luminary will be absorbed in that of the greater, and the name of Goethe will represent alone and unrivalled the literature of his age and country.

Schiller's  
death.

Schiller was happy in the occasion of his death. He did not see the troubles which immediately afterwards burst upon Thuringia. On October 14, 1806, the battle of Jena was fought. The court had fled from Weimar; only the duchess Louise remained. In the evening of the defeat Weimar was plundered by the conquering troops. Many of Goethe's friends lost everything they possessed. His property and perhaps his life was saved by the firmness of Christiane, and afterwards by the billeting of Marshal Augereau in his house. On the 15th Napoleon entered the town, but Goethe did not go to see him. The duchess obtained her husband's pardon by her entreaties. It was not till the autumn of 1808 that Napoleon and Goethe, perhaps the two greatest men then living in Europe, met and conversed. It was at the congress of Erfurt, where the sovereigns and princes of Europe were assembled. Goethe's presence was commanded by the duke. He was attracted at least as much by the prospect of seeing Talma as of meeting Napoleon. He was invited to an audience on October 2; Talleyrand, Berthier, and Savary were present. The emperor sat at a large round table eating his breakfast. He beckoned Goethe to approach him, and said to him, "Vous êtes un homme!" He asked how old he was, expressed his wonder at the freshness of his appearance, said that he had read *Werther* through seven times, and made some acute remarks on the management of the plot. Then, after an interruption, he said that tragedy ought to be the school of kings and peoples; that there was no subject worthier of treatment than the death of Cæsar, which Voltaire had treated insufficiently. A great poet would have given prominence to Cæsar's plans for the regeneration of the world, and shown what a loss mankind had suffered by his murder. He invited Goethe to Paris; that was the centre of great movements; there he would find subjects worthy of his skill. They parted with mutual admiration. The bust of Napoleon was a prominent ornament in Goethe's study.

In the same year, 1808, an edition of Goethe's works *Faust* in thirteen volumes was published by Cotta at Tübingen. It is remarkable as containing the first part of *Faust* in its complete form. The principal portions of the drama had already been published as a fragment in 1790. It had then attracted but little attention. Heyne wrote of it—"There are fine passages in it, but with them there are such things as only he could give to the world who takes other men to be blockheads." Wieland and Schiller were apparently dissatisfied with it. It had perhaps the appearance of patchwork, as it was made up of fragments which had been written at very different periods of his life. The idea of writing *Faust* seems to have come to Goethe in his earliest manhood. He was brooding over it at the same time with *Gotz von Berlichingen*, but at Strasburg he spoke to Herder of neither. He apparently began to write it down at the same time as *Werther* in 1774, and we find mention of its progress in the two following years; indeed, all the important parts of the fragment which appeared in 1790 were known to Jacobi before 1776. He took the work with him to Italy, where he added little to it except the scene in the witches' kitchen. The dedication, the "Prologue in Heaven," which presents to the reader the idea of the whole work, the prelude on the stage copied from the Indian drama, the lyrical intermezzo, the scene with Wagner before the city gate, and the scene with Mephistopheles in the study were written before 1800. In that year he was busy with *Helena* for the second part, and he added nothing afterwards to the first except the "Walpurgis Night" and the scene of Valentine's death. *Faust* justly stands at the head of all Goethe's works, and it deserves a very high place among the best works of every age. Founded on a well-known popular tale, indebted for its interest and

pathos to incidents of universal experience, it deals with the deepest problems which can engage the mind of man. In this combination of qualities it is perhaps superior to any one of Shakespeare's plays. The plot is as simple and as well known to the audience as the plot of a Greek tragedy. The innocence and the fall of Gretchen appeal to every heart; the inward struggles of Faust, like those of Hamlet, and the antagonism of the sensual and moral principles, interest the reader just in proportion as his own mind and nature have been similarly stirred. Each line is made to stand for eternity; not a word is thrown away; the poem has entered as a whole into the mind and thought of modern Germany; nearly every expression has become a household word. Characters are sketched in a single scene; Valentine lives for us as clearly as Faust himself. Deeper meanings are opened up at every reading, and the next age will discover much in it which is concealed from this. Goethe, writing of *Faust* in his eightieth year, says with truth, "The commendation which the poem has received far and near may be perhaps owing to this quality, that it permanently preserves the period of development of a human soul which is tormented by all that afflicts mankind, shaken also by all that disturbs it, repelled by all that it finds repellent, and made happy by all that it desires. The author is at present far removed from such conditions; the world likewise has to some extent other struggles to undergo; nevertheless the state of man, in joy and sorrow, remains very much the same, and the latest born will still find cause to acquaint himself with what has been enjoyed and suffered before him in order to adapt himself to that which awaits him."

*Wahlverwandtschaften.* In 1809 he finished *Die Wahlverwandtschaften* (The Elective Affinities), a story which is always cited to prove the immoral tendency of his works. A married couple, Edward and Charlotte, are thrown into constant companionship with two unmarried persons, the Captain and Ottilie. A cross attraction takes place similar to that which is often seen in chemical experiments. Edward unites himself with Ottilie, Charlotte with the Captain. The psychological changes by which this result is produced are portrayed with a masterly hand. The moral may be held by some to exalt the preponderance of fatality in human affairs, and the uselessness of contending against irresistible circumstances. Others may believe that the story is intended to show the disastrous calamities which may be wrought by a weak and self-indulgent will. Ottilie, though she cannot resist her passion, has strength enough to starve herself to death; Edward is the prototype of Arthur Donnithorne and Tito Melema. The work is replete with earnest purpose and terrible warning.

*Farbenlehre.* In 1810 Goethe finished the printing of his *Farbenlehre* (Theory of Colours), a work which had occupied his mind ever since his journey to Italy. His theories were rejected and disregarded by his contemporaries, but he left them with confidence to the judgment of posterity. Goethe's labours in this domain fall into two natural divisions—one in which he tries to prove that the hypotheses of Newton are unsatisfactory, and another in which he promulgates a theory of his own. In his first work, published in 1791 and 1792, he describes with great accuracy and liveliness the experiments which he has made. They consist chiefly of the appearances presented by white discs on a black ground, black discs on a white ground, and coloured discs on a black or white ground when seen through a prism. There are two points which he considers fatal to Newton's theory,—that the centre of a broad white surface remains white when seen through a prism, and that even a black streak on a white ground can be entirely decomposed into colours. The scientific friends to whom he communicated these observations assured him that there was

nothing in them opposed to Newton's theory,—that they were even confirmations of it. He would not be convinced, and took no pains to acquire that exact knowledge of mathematics and geometrical reasoning without which the more abstruse problems of physical optics could not be intelligible. He went on further to formulate a theory of his own. His views on the subject are contained in their shortest form in a letter addressed to Jacobi from the camp at Marienburg in July 1793. They are divided into six heads, of which the following is an abstract. (1.) Light is the simplest matter we have knowledge of, the least capable of analysis, the most homogeneous. It is not a compound body. (2.) Least of all is it compounded of coloured lights. Every coloured light is darker than colourless light. Brightness cannot be compounded of darkness. (3.) Inflection, refraction, reflexion, are three conditions under which we often observe apparent colours, but they are rather occasions for their appearance than the cause of it. (4.) There are only two pure colours, blue and yellow; red may be regarded as a property of both of them. There are two mixed colours, green and purple; the rest are gradations of these colours, and are not pure. (5.) Colourless light cannot be produced out of coloured lights, nor white from coloured pigments. (6.) The colours which appear to us arise solely out of a modification of the light. The colours are excited in the light, not developed out of the light. These views he afterwards extended and explained, but very slightly modified. In Goethe's opinion, yellow was light seen through a thickened medium; blue was darkness seen through an illuminated medium; all other colours were derived from these two. The theory of the *Farbenlehre* has not yet received the recognition which Goethe anticipated for it. In his own day he had some adherents,—the most distinguished perhaps was the philosopher Hegel, whose views, however, of natural philosophy have caused many inquirers to recoil from his theory of metaphysics. Goethe complained that no physicist believed in him, and as that is still true in an age which has been devoted more than any other to physical inquiries, we may conclude that the principle upon which his theories are based is radically wrong.

The year 1809, in which *Die Wahlverwandtschaften* was written, was for Goethe the beginning of a new era. He was then fresher and brighter than he had been for ten years before. He had lived through a troubled period of oppressive sorrow. The death of Schiller, the violation of his beloved Weimar, the deaths of the duchess Amalia and of his mother, his own bodily and mental sufferings, had given a tone of sadness to his poetry. As if to put the finishing stroke to the efforts of his life, he married the mother of his children, arranged and published his collected works, and completed his theory of colours. The unfinished drama of *Pandora* is a symbol of this time. The part which is completed refers only to past experiences of sadness; the continuation was to have lifted the curtain of future hope.

It was natural at the beginning of a new course of life that Goethe should write an account of his past existence. The study of his collected poems made it apparent to him how necessary it was to furnish a key by which they might be understood. These various causes led to the composition of *Autobiographie* (*Dichtung und Wahrheit* (Poetry and Truth), an autobiographical history of the poet's life from his birth till his settlement at Weimar. This work is the cause of much embarrassment to the poet's biographers. Where it ought to be the most trustworthy source of information, it is most misleading. It is probable that Goethe intended it to be an accurate and circumstantial account of his life. But the inner life of an individual is more clear to him than the outer. The stages of our self-development are better remembered than the exact circumstances which produced them, still less than the order of time in which they followed each other. Goethe

took pains to ascertain facts which he had forgotten. But he was so conscious that imagination would play a large part in the composition that in the title he gave poetry the precedence before truth. The indefatigable industry of German investigation has laid open before us every detail of the poet's life and every phase of his feeling. *Dichtung und Wahrheit*, if it has lost its rank as a history, still keeps its place as a classic. The simple loving delineation of the childhood of genius is as fresh as ever, and is of more universal interest from being less particular. The first five books of this autobiography appeared in 1811, the next five in 1812, the third instalment at Easter 1814, and the conclusion after Goethe's death. The period during which this was his principal work witnessed the greatest political event of the first half of our century, the rising of the German people against the power of Napoleon. In this Goethe took no share, and with it he apparently felt little sympathy. He made no impassioned orations to his countrymen like Fichte; he wrote no inspiring lays like Körner. The ballads which he composed in 1813 are harmless enough,—*Der wandelnde Glocke*, *Der getreue Eckhart*, *Der Todtentanz*. He saw Stein and Arndt at Dresden in 1813, but disappointed them by his impassive manner. He said to Körner's father at the same time, "Yes, shake your chains! The man is too great for you. You will not break them, but only drive them deeper into your flesh." The reasons for this apparent coldness are perhaps more simple than they appear at first sight. Goethe was a man of thought rather than of action. Although a fair portion of his long life was given to the practical business of his adopted country, his heart was always in speculation or artistic production. While inspecting mines he was spinning theories of geological formation; while working for the war commission he gladly ran away to the castle of Dornburg to bury himself amongst his deserted papers. The pressure of court business at Weimar drove him to the solitude of Italy. In the defiles of the Argonne, and in the trenches before Mainz, he was scheming and arranging his theory of colours. A bombardment was valued by him less as an attack upon the enemy than as a series of interesting experiments in optics. Added to this natural indifference to the details of human affairs was his belief in the predominance of force, and in the necessary evolution of the history of the world. Napoleon was to him the greatest living depository of power. Nations, whether conquered or victorious, separated or united, obeyed a common law against which individual will strove in vain. Goethe was thus incapacitated for politics, both by his qualities and his defects. This habit of abstract contemplation grew upon him in later life. Those who condemn him on this ground should remember that he hailed in no grudging spirit the formation of a united Germany, and that his works have been the most potent agency in making all Germans feel that they are one. Few would wish to exchange the self-conflict of *Faust*, or even the wayward wanderings of *Meister*, for the hectic extravagance of Körner or the unsubstantial rhetoric of Posa.

It was hardly to be expected that at the age of sixty-five Goethe should strike out new lines of poetical activity. However, in the *West-östliche Divan*, he made the first attempt to transplant Eastern poetry to a German soil, and set an example which has been followed by Heine and Mirza Schaffy. In 1811 he first became acquainted with the works of Hafiz in Hammer's translation. At a time when North and South and West were splitting in sunder, when thrones were breaking up and empires trembling, he sought a willing refuge in the restoring fountain of the Eastern poet. The book *Timur* has an obvious reference to the expedition of Napoleon in Russia, but the large majority of the poems are amatory, and are addressed to an imaginary Suleika,

whose name is given to one of the books. Once more in his old age Goethe came under the sovereignty of a woman. She was Marianne von Willemer, the newly married wife of a Frankfort banker, Jacob von Willemer, who was an old friend of Goethe's and of his brother-in-law Schlosser. Goethe made her acquaintance in a journey which he took in the Rhine country with Sulpiz Boiserée, who had succeeded in interesting Goethe in early German art, a subject to which he was himself devoted. The correspondence between Goethe and Marianne was published in 1877. It extends almost to the day of his death, and includes letters from Eckermann giving an account of his last moments. Not only were most of the *Divan* poems addressed to Suleika, but several of those included in the collection are by Marianne herself, and will bear comparison with those of Goethe. In these poems the Oriental form is not very strictly observed. The fondness of the Orientals for the repetition of single rhymes is not attended to, and if sometimes remembered is soon forgotten. Their Eastern colour depends rather on the suggestion of Eastern scenery and the introduction of Eastern names. This, however, gives the poet a greater licence to levity, to fatalism, and to passion than would have been possible in poems of a purely German character.

The last twelve years of Goethe's life, when he had passed his seventieth birthday, were occupied by his criticisms on the literature of foreign countries, by the *Wanderjahre*, and the second part of *Faust*. He was the literary dictator of Germany and of Europe. He took but little interest in the direction in which the younger German school was moving, and was driven to turn his eyes abroad. He conceived an intense admiration for Byron, which was increased by his early death. Byron appears as Euphion in the second part of *Faust*. He also recognized the greatness of Scott, and was one of the first to send a greeting to the Italian Mazzini. He conceived the idea of a world-literature transcending the narrow limits of race and country, which should unite all nations in harmony of feeling and aspiration. German writers claim that his design has been realized, and the literature of every age and country can be studied in a tongue which Goethe had made rich, flexible, and serviceable for the purpose. The *Wanderjahre*, although it contains some of Goethe's most beautiful conceptions, The Flight into Egypt, The Description of the Pedagogic Province, The Parable of the Three Reverences, is yet an ill-assorted collection of all kinds of writings, old and new. Its author never succeeded in giving it form or coherency, and his later style, beautiful as it is, becomes in these years vague and abstract. Still without this work we should not be acquainted with the full richness and power of his mind.

The second part of *Faust* has been a battlefield of controversy since its publication, and demands fuller attention. Its fate may be compared with that of the latest works of Beethoven. For a long time it was regarded as impossible to understand, and as not worth understanding, the production of a great artist whose faculties had been impaired by age. By degrees it has, by careful labour, become intelligible to us, and the conviction is growing that it is the deepest and most important work of the author's life. Its composition cannot be called an after-thought. There is no doubt that the poet finished at the age of eighty the plan which he had conceived sixty years before. The work in its entirety may be described as the first part of *Faust* "writ large." This is a picture of the macrocosm of society as that was of the microcosm of the individual. The parallelism between the two dramas is not perfect, but it reveals itself more and more clearly to a patient study. Some points of this similarity have been well expressed by Rosenkranz (quoted by Bayard Taylor):—"Both parts are

The war of liberation.

West-östliche Divan.

The closing years.

Meister's Wanderjahre.

Second part of Faust.

symmetrical in their structure. The first moves with deliberate swiftness from heaven through the world to hell; the second returns therefrom through the world to heaven. Between the two lies the emancipation of Faust from the torment of his conscious guilt, lies his Lethe, his assimilation of the past. In regard to substance, the first part begins religiously, becomes metaphysical, and terminates ethically; the second part begins ethically, becomes æsthetic, and terminates religiously. In one, love and knowledge are confronted with each other; in the other, practical activity and art, the ideal of the beautiful. In regard to form, the first part advances from the hymnal shout to monologue and dialogue; the second part from monologue and dialogue to the dithyrambic, closing with the hymn, which here glorifies not alone the Lord and His uncomprehended lofty works, but the human in the process of its union with the divine, through redemption and atonement." The first act, with its varied scenes of country, castle, garden, galleries, and halls, answers to the two prologues of the first part; the second act introduces us again to Faust's study and his familiar Wagner. The classical Walpurgis Night has its prototype in the first part. The third act is devoted to Helena, who is the heroine of the second part as Gretchen is of the first. The marriage of Faust and Helena typifies the union of the classical and romantic schools, and their child is Euphorion, who is symbolical of Byron. In the fourth act Faust is raised instead of being degraded by his union with Helena. He wishes for a sphere of beneficent activity, and obtains it by war. The fifth act is devoted to the complete regeneration of the soul of Faust. Even the sight of all that he has accomplished does not satisfy him. It is not until he is blind to outward objects that one moment of divine rapture reveals to him the continuance of his work in coming generations, and convinces him that he has not lived in vain. In this one moment of supreme happiness he dies. The struggle for the possession of Faust's soul, indicated in the first part, is fully elaborated in the second. Mephistopheles is shown to have worked out the good in spite of himself, and Margaret appears transfigured as the revelation to man of the divine love.

With the completion of Faust, Goethe felt that the work of his life was accomplished. He still continued to work with regularity. He ordered and arranged his writings, he laboured at his *Tages- und Jahresheften*, an autobiographical journal of his life. He bated not one jot of heart or hope, and took the liveliest interest in every movement of literature and science. When the news of the July Revolution of 1830 reached Weimar, Goethe was excited beyond his wont, not on account of the triumph of liberal principles, but because the controversy between Cuvier and Geoffrey St Hilaire had been decided in favour of the latter. Still he had much to darken his latter days. His old friends were falling fast around him. His wife had died in 1816, after a union of thirty years. He felt her loss bitterly. The duchess Amalia had died eight years before, not long after the death of his own mother. He now had to undergo bitterer experiences when he was less able to bear them. Frau von Stein, with whom he had renewed his friendship if not his love, died in January 1827; and in June 1828 he lost the companion of his youth, the grand-duke Karl August, who died suddenly, away from Weimar, on his return from a journey. Goethe received the news with outward calmness, but said forebodingly, "Now it is all over," and went to mourn and labour at the castle of Dornburg, where everything reminded him of the days of their early friendship. The duchess Louise survived her husband till February 1830. When Goethe died in 1832 none of the old Weimar set were left except Knebel, who lived two years longer. A greater blow than these was the death of his only son, whom, in spite of his moral weakness, his father deeply loved.

He died at Rome in October 1830, and is buried close by the pyramid of Caius Cestius, where Goethe himself once desired to be laid. We have a full account of the last nine years of Goethe's life from the writings of Eckermann, who became his secretary in 1823, lived with him till his death, and has noted down his conversations and his habits with the minuteness and fidelity of a Boswell.

We must pass on to the closing scene. On Thursday, <sup>His</sup> March 15, 1832, he spent his last cheerful and happy day. <sup>death.</sup> He was visited by the grand-duchess and other friends. He awoke the next morning with a chill. From this he gradually recovered, and on Monday was so much better that he designed to begin his regular work on the next day. But in the middle of the night he woke up with a deathly coldness, which extended from his hands over his body, and which it took many hours to subdue. It then appeared that the lungs were attacked, and that there was no hope of his recovery. Goethe did not anticipate death. He sat fully clothed in his arm-chair, made attempts to reach his study, spoke confidently of his recovery, and of the walks he would take in the fine April days. His daughter-in-law Ottilie tended him faithfully. On the morning of the 22d his strength gradually left him. He sat slumbering in his arm-chair holding Ottilie's hand. Her name was constantly on his lips. His mind occasionally wandered, at one time to his beloved Schiller, at another to a fair female head with black curls, some passion of his youth. His last words were an order to his servant to open the second shutter to let in more light. After this he traced with his forefinger letters in the air. At half-past eleven in the day he drew himself, without any sign of pain, into the left corner of his arm-chair, and went so peacefully to sleep that it was long before the watchers knew that his spirit was really gone. He is buried in the grand-ducal vault, where the bones of Schiller are also laid.

Goethe differs from all other great writers, except perhaps Milton, in this respect, that his works cannot be understood without a knowledge of his life, and that his life is in itself a work of art, greater than any work which it created. This renders a long and circumstantial biography a necessity to all who would study the poet seriously. At the same time he is so great that we are even now scarcely sufficiently removed from him to be able to form a correct judgment of his place in literary history. He is not only the greatest poet of Germany; he is one of the greatest poets of all ages. Posterity must decide his exact precedence in that small and chosen company which contains the names of Homer, Dante, and Shakespeare. He was the apostle of self-culture. Always striving after objective truth, and sometimes attaining to it, he exhibited to the world every phase of his plastic mind in turn, and taught both by precept and example the husbandry of the soul. The charge of selfishness so often brought against him cannot be maintained. His nature responded to every influence of passing emotion. Like a delicate harp, it was silent if not touched, and yet gave its music to every wooing of the wilful wind. The charge of unsympathetic coldness roused the deep indignation of those who knew him best. He learned by sad experience that the lesson of life is to renounce. Rather than cavil at his statuesque repose, we should learn to admire the self-conflict and self-command which moulded the exuberance of his impulsive nature into monumental symmetry and proportion. His autobiography has done him wrong. It is the story not of his life, but of his recollections. He needs no defence, nothing but sympathetic study. As Homer concentrated in himself the spirit of antiquity, Dante of the Middle Ages, and Shakespeare of the Renaissance, so Goethe is the representative of the modern spirit, the prophet of mankind under new circumstances and new conditions, the appointed teacher of ages yet unborn.

*Bibliography.*—A complete bibliography of Goethe literature would fill a very large space. We must content ourselves with an indication of the principal sources from which a knowledge of his life may be derived. The most important source of all is his own works. The *Dichtung und Wahrheit*, the *Italianische Reise*, the *Campagne am Rhein*, and the *Tages- und Jahreshften* have an especial autobiographical value. Next to these come the poems, and lastly the letters. Many of these are lost for ever, many remain unpublished. For the first period of his life *Der Junge Goethe*, in three volumes, published by Hirzel, with an introduction by Michael Bernays, is indispensable. It contains his letters and poems in chronological order. A commentary on this work by Wilhelm Scherer, entitled *Aus Goethes Frühzeit* was published in 1879. Otto Jahn published *Goethes Briefe an seiner Leipziger Freunde*. Schöll and A. Hober have collected the letters of the Strasburg period. Goethe's correspondence with Schiller and with Zelter was published during his lifetime. Besides these we have his letters to Herder, Merck, Kestner and Lotte, Lavater, Knebel, Countess Stolberg, Jacobi, Karl August, and Frau von Stein. Lately have appeared his letters to Marianne von Willemer, and some of those addressed to J. G. Schlosser. We are without his letters to Behrisch, Lersé, and Zimmermann; and we have only a few of those addressed to Horn and Sophie La Roche. Goethe's real letters to Bettina von Arnim are in the main unpublished; those which bear the name have been largely falsified, but have a substratum of truth. We have also a few volumes of Goethe's scientific correspondence, published by his descendants. Help to the understanding of his poetry is given by the letters of Wieland, Caroline Flachsland, and his Weimar friends. The letters addressed to him by Frau von Stein exist, but have not been made public. The first life of Goethe was published by Döring in 1828, of which a second enlarged edition appeared after the poet's death in 1833. Then followed Viehoff in 4 volumes, 1847–1853. The best life of Goethe is that of Schäfer, which appeared first in 1851, and the third edition of which dates from 1877. It is contained in two volumes of moderate size, and is written with scarcely a superfluous word. The account of Goethe and Schiller by Karl Goedeke in his *Grundriss der Deutschen Dichtung* is admirable, and so is the little book *Goethes Leben und Schriften*,

published by him in 1874. The life of Goethe has been popularized in England by G. H. Lewes, in a work which is as much read in German as in English. A complete biography of Goethe cannot be written until the archives of the Goethe Haus at Weimar are thrown open for consultation. The knowledge of Goethe's works in England is due as much as anything else to the writings of Thomas Carlyle. The commentaries on Goethe's works are endless in number. The most active labourer in this field has been H. Düntze, who has left no side of Goethe's activity and no period of his life unexplored. We must also mention the brilliant lectures on Goethe by Hermann Grimm (Berlin, 1877), and the excellent sketch of his life and works published by A. Hayward in 1878. The following works deserve particular mention:—

*Aus Goethes Knabenzeit 1757–59, Mittheilungen aus einem Originalmanuscript der Frankfurter Stadtbibliothek*, erläutert und herausgegeben von Dr H. Weismann, Frankfurt, 1846; *Briefe an J. H. Merck von Goethe, Herder, Wieland, und andern bedeutenden Zeitgenossen*, hrsg. von K. Wagner, Darmstadt, 1835; *Briefe aus dem Freundeskreise von Goethe, Herder, Höpfer, und Merck*, hrsg. von Dr K. Wagner, Leipsic, 1847; *Briefe Goethes an Frau von Stein aus den Jahren 1776–1826*, hrsg. durch A. Schöll, 3 vols., Weimar, 1848–1851; *Briefe Goethes an die Gräfin Auguste zu Stolberg*, Leipsic, 1839; *Briefe Goethes an Lavater, aus den Jahren 1774–83*, hrsg. von Heinr. Herzel, Leipsic, 1833; *Briefe Goethes an Leipziger Freunde*, hrsg. von O. Jahn, Leipsic, 1849; *Briefe Goethes in den Jahren 1768–1832*, hrsg. von H. Döring, Leipsic, 1836; *Briefwechsel d. Grossherzogs Karl August v. Sachsen-Weimar-Eisenach mit Goethe in den Jahren von 1775 bis 1828*, 2 vols., Weimar and Leipsic, 1863; *Briefwechsel zwischen Goethe u. F. H. Jacobi*, hrsg. v. Max Jacobi, Leipsic, 1847; *Briefwechsel zwischen Goethe und Zelter in den Jahren 1796–1832*, hrsg. von Fr. W. Riemer, 8 parts, Berlin, 1833–34–36; *Briefwechsel zwischen Goethe u. Marianne von Willemer (Suleika)*, hrsg. mit Lebensnachrichten, &c., von Th. Creizenach, Stuttgart, 1877; H. Döring, *Goethes Leben*, Weimar, 1828, 2d ed., Jena, 1833; and Goedeke, *Goethes Leben u. Schriften*, Stuttgart, 1874, *Goethes Sammlungen*, 3 parts, Jena, Leipsic, 1848, 1849; Dr Karl Mendelssohn-Bartholdy, *Goethe u. Felix Mendelssohn Bartholdy*, Leipsic, 1871; *Neue Mittheilungen aus Johann Wolfgang von Goethes handschriftlichem Nachlasse*, 8 parts, Leipsic, 1874–76; Dr J. W. Schäfer, *Goethes Leben*, 2 vols., 8th ed., Leipsic, 1877; H. Viehoff, *Goethes Leben*, 3 parts, Stuttgart, 1847–49; Franz Wegele, *Goethe als Historiker*, 1876; Zellenck, *Die Beziehungen Goethes zu Spinoza*, 1878; Edmund Hofer, *Goethe und Charlotte von Stein*, Stuttgart, 1878; *Briefe Goethes an Sophie la Roche und Bettina Brentano*, hrsg. von C. Loeper, Berlin, 1879 (a most valuable little book); Graf Ferdinand von Dürkheim, *Liliths Bild geschichtlich entworfen*, 1879; C. A. H. Burkhardt, *Goethe und der Componist Ph. Chr. Kayser*, Leipsic, 1879; Vinc. Prokl, *Goethe in Eger*, Vienna, 1879. (O. B.)

GOETZ, HERMANN (1840–1876), a musical composer, presents one of those instances, too frequent in the history of art, of success long sought for, and cut short by death when achieved at last. He was born at Königsburg in Prussia in 1840, and began his regular musical studies at the comparatively advanced age of seventeen. He entered the music-school of Professor Stern at Berlin, and studied composition chiefly under Ulrich and Hans von Bülow. In 1863 he was appointed organist at Winterthur in Switzerland, where he lived in obscurity for a number of years, occupying himself with composition during his leisure hours. One of his works was an opera, *The Taming of the Shrew*, the libretto skilfully adapted from Shakespeare's play. After much delay it was produced at Mannheim (October 1874), and its success was as instantaneous as it has up to the present proved lasting. It rapidly made the round of the great German theatres, and spread its composer's fame over all the land. But Goetz did not live to enjoy this happy result for long. In December 1876 he died at Zurich from overwork. A second opera, *Francesca da Rimini*, on which he was engaged at the time of his death, remained a fragment; but it has since been finished according to his directions by a friend,

and was performed for the first time at Mannheim a few months after the composer's death. Besides his dramatic work, Goetz also wrote various compositions for chamber-music, of which a trio (Op. 1) and a quintet (Op. 16) have been given with great success at the London Monday Popular Concerts. Still more important is the *Symphony in F*, on which the composer's great reputation in England is mainly founded. As a composer of comic opera Goetz lacks the sprightliness and artistic *savoir faire* so rarely found amongst Germanic nations. His was essentially a serious nature, and passion and pathos were to him more congenial than humour. The more serious sides of the subject are therefore insisted upon more successfully than Katherine's ravings and Petruchio's eccentricities. (There are, however, very graceful passages, e.g., the singing lesson Bianca receives from her disguised lover.) Goetz's style, although influenced by Wagner and other masters, shows signs of a distinct individuality. The design of his music is essentially of a polyphonic character, and the working out and interweaving of his themes betray the musician of high scholarship. But breadth and beautiful flow of melody also were his, as is seen in the symphony, and perhaps still more in the quintet for pianoforte and strings above

referred to. The most important of Goetz's posthumous works are a setting of the 137th Psalm for soprano solo, chorus, and orchestra, a "Spring" overture (Op. 15), and a pianoforte sonata for four hands (Op. 17).

GOG (גִּיג) occurs in two passages of Scripture (Ezek. xxxviii.—xxxix., and Rev. xx.) as the name of a great anti-theocratic power destined to manifest itself in the world immediately before the final dispensation is ushered in. In the later passage, Gog and Magog are spoken of as co-ordinate; in the earlier, Gog is given as the name of the person or people, and Magog as that of the land of its origin. Notwithstanding this discrepancy, it is obvious that the passages are intimately related, and that both depend upon Gen. x. 2, where, however, Magog alone is mentioned. Here he is the second son of Japhet, and, on the assumption that a geographical order underlies these ethnographical tables, his locality is to be sought between Gomer and Madai or Media. According to Josephus, who is followed by Jerome, the Scythians were primarily intended by this designation; and this opinion has been almost universally accepted in modern times. The name *Σκύθαι*, it is to be observed, however, is often but a vague word for any or all of the numerous and but partially known tribes of the north; and any attempt to assign a more definite locality to Magog can only be very hesitatingly made. According to some, the Maiotes about the Palus Mæotis are meant; according to others, the Massagetæ; according to Kiepert, the inhabitants of the northern and eastern parts of Armenia. In Ezekiel, Gog is regarded as a terrible ruler in the extreme north, being prince of Rosh, Mesech, and Tubal, as well as governor in the land of Magog, and having the support of Persia, Ethiopia, and Phut, as well as of Gomer and the house of Togarmah. It may be considered as certain that the imagery employed in this prophetic description was suggested by the Scythian invasion which about the time of Josiah had devastated Asia (Herod. i. 103 ff.). As might have been expected from the prominence given to that description in the Old Testament, Gog figures largely in Jewish and Mahometan as well as Christian eschatology. In the district of Astrakhan a legend is still to be met with, to the effect that Gog and Magog were two great races, which Alexander the Great subdued and banished to the inmost recesses of the Caucasus, where they are meanwhile kept in by the terror of twelve trumpets blown by the winds, but whence they are destined ultimately to make their escape and destroy the world. The legends that attach themselves to the effigies of Gog and Magog which are at present to be seen in Guild Hall, London, are only remotely connected, if at all, with the statements of Scripture. According to the *Recuyell des Histoires de Troye*, Gog and Magog were the survivors of a race of giants descended from the thirty-three wicked daughters of Diocletian; after their brethren had been slain by Brute and his companions, Gog and Magog were brought to London (Troy-novant), and compelled to officiate as porters at the gate of the royal palace. It is known that effigies similar to the present existed in London as early as the time of Henry V.; but it is uncertain at what date this legend first began to attach to them. According to Geoffrey of Monmouth (*Chronicles*, i. 16), Goëmot or Goëmagot (either corrupted from or corrupted into "Gog and Magog") was a giant who, along with his brother Corineus, tyrannized in the western horn of England until slain by foreign invaders.

GOGO, or ГНОГНА, a town in Ahmadabad district, Bombay, 193 miles north-west of Bombay. About three-quarters of a mile east of the town is an excellent anchorage, in some measure sheltered by the island of Perim, which lies still further east. The natives of this are reckoned the best sailors in India; and ships touching

here may procure water and supplies, or repair damages. It is a safe refuge during the south-west monsoon, or for vessels that have parted from their anchors in the Surat roads, the bottom being an entire bed of mud, three-quarters of a mile from the shore, and the water always smooth. Gogo has of late years lost its commercial importance. Its rival, Bhaunagar, is 8 miles nearer to the cotton districts. North of the town is a black salt marsh, extending to the Bhaunagar creek. On the other sides is undulating cultivated land, sloping to the range of hills 12 miles off. South of the town there is another salt marsh. The land in the neighbourhood is inundated at high spring tides, which renders it necessary to bring fresh water from a distance of 4 or 5 miles. The average annual value of the exports for five years ending 1871-72 was £56,227 and of the imports £103,083. Population (1872), 9571.

GOGOL, NIKOLAI VASILIEVICH (1809-1852), was born in the province of Poltava, in South Russia, March 31, 1809. Educated at the Niejin gymnasium, he there started a manuscript periodical, "The Star," and wrote several pieces including a tragedy, *The Brigands*. Having completed his course at Niejin, he went in 1829 to St Petersburg, where he tried the stage but failed. Next year he obtained a clerkship in the department of appanages, but he soon gave it up. In literature, however, he found his true vocation. In 1829 he published anonymously a poem called *Italy*, and, under the pseudonym of V. Alov, an idyll, *Hans Kuchel Garten*, which he had written while still at Niejin. The idyll was so ridiculed by a reviewer that its author bought up all the copies he could secure, and burnt them in a room which he hired for the purpose at an inn. Gogol then fell back upon South Russian popular literature, and especially the tales of Cossackdom on which his boyish fancy had been nursed, his father having occupied the post of "regimental secretary," one of the honorary officials in the Zaporogian Cossack forces. In 1830 he published in a periodical the first of the stories which appeared next year under the title of *Evenings in a Farm near Dikanka: by Rudly Panko*. This work, containing a series of attractive pictures of that Little-Russian life which lends itself to romance more readily than does the monotony of "Great-Russian" existence, immediately obtained a great success,—its light and colour, its freshness and originality, being hailed with enthusiasm by the principal writers of the day in Russia. Whereupon Gogol planned, not only a history of Little-Russia, but also one of the Middle Ages, to be completed in eight or nine volumes. This plan he did not carry out, though it led to his being appointed to a professorship in the university of St Petersburg, a post in which he met with small success, and which he resigned in 1835. Meanwhile he had published his *Arabesques*, a collection of essays and stories; his *Taras Bulba*, the chief of the *Cossack Tales* translated into English by George Tolstoy; and a number of novelettes, which mark his transition from the romantic to the realistic school of fiction, such as the admirable sketch of the tranquil life led in a quiet country house by two kindly specimens of *Old-world Gentlefolks*, or the description of the petty miseries endured by an ill-paid clerk in a Government office, the great object of whose life is to secure the "cloak" from which his story takes its name. To the same period belongs his celebrated comedy, the *Revizor*, or Government Inspector. His aim in writing it was to drag into light "all that was bad in Russia," and to hold it up to contempt. And he succeeded in rendering contemptible and ludicrous the official life of Russia, the corruption universally prevailing throughout the civil service, the alternate arrogance and servility of men in office. The plot of the comedy is very simple. A traveller who arrives with an empty purse at a provincial town is taken for an

inspector whose arrival is awaited with fear, and he receives all the attentions and bribes which are meant to propitiate the dreaded investigator of abuses. The play appeared on the stage in the spring of 1836, and achieved a full success, in spite of the opposition attempted by the official classes whose malpractices it exposed. The aim which Gogol had in view when writing the *Revizor* he afterwards fully attained in his great novel, *Mertvuiya Dushi*, or *Dead Souls*, the first part of which appeared in 1842. The hero of the story is an adventurer who goes about Russia making fictitious purchases of "dead souls," i.e., of serfs who have died since the last census, with the view of pledging his imaginary property to Government. But his adventures are merely an excuse for drawing a series of pictures, of an unfavourable kind, of Russian provincial life, and of introducing on the scene a number of types of Russian society. Of the force and truth with which these delineations are executed the universal consent of Russian critics in their favour may be taken as a measure. From the French version of the story a general idea of its merits may be formed, and some knowledge of its plot and its principal characters may be gathered from the English adaptation published in 1854, as an original work, under the title of *Home Life in Russia*. But no one seems to be able fully to appreciate Gogol's merits as a humorist, who is not intimate with the language in which he wrote as well as with the society which he depicted. In 1836 Gogol for the first time went abroad. Subsequently he spent a considerable amount of time out of Russia, chiefly in Italy, where much of his *Dead Souls* was written. His residence there, especially at Rome, made a deep impression on his mind, which, during his later years, turned towards mysticism. The last works which he published, his *Confession* and *Correspondence with Friends*, offer a painful contrast to the light, bright, vigorous, realistic, humorous writings which had gained and have retained for him his immense popularity in his native land. Asceticism and mystical exaltation had told upon his nervous system, and its feeble condition showed itself in his literary compositions. In 1848 he made a pilgrimage to Jerusalem, and on his return settled down at Moscow, where he died, March 3, 1852, not having quite completed his forty-third year.

GOITO, a large village of Italy, in the province of Mantua and district of Volta, situated on the right bank of the Mincio, about 14 miles from Castiglione, on the highway between Brescia and Mantua. Its position has made it figure from time to time in the records of Italian warfare. In 1701 it was taken by the allies, in 1706 by the prince of Hesse, and in 1796 by the French. It was the scene of a severe conflict between the French and the Austrians in 1814; and in 1848 it saw the defeat of the Austrians by the Piedmontese. The population of the commune in 1871 was 5274.

GOITRE (from *guttur*, the throat; synonyms, *Bronchocele*, *Derbyshire Neck*), a term in medicine applied to a swelling in the front of the neck caused by an enlargement of the thyroid gland. This structure, which lies between the skin and anterior surface of the windpipe, and in health is not large enough to give rise to any external prominence, is liable to occasional variations in size, more especially in females, a temporary enlargement of the gland being not uncommon at the catamenial periods, as well as during pregnancy. In the disease now under consideration, however, the swelling is well marked, and is not only unsightly, but may by its growth occasion much discomfort, and even give rise to serious symptoms from its encroachment on the windpipe and other important parts in the neck. The size to which goitrous growths may attain is extraordinary, Alibert recording cases of goitre where the tumour not only

enormously enlarged the neck but hung down over the breast, or even reached as low as the middle of the thigh.

In districts where the disease prevails the goitre usually appears in early life, often from the eighth to the twelfth year. Its growth is at first slow, but after several years of comparative quiescence a somewhat sudden increase is a not unfrequent occurrence. In the earlier stages of the disease the condition of the gland is simply an enlargement of its constituent parts, which retain their normal soft consistence; but in the course of time other changes supervene, and it may become the seat of cystic formations, or acquire hardness from increase of connective tissue or calcareous deposits. Occasionally the enlargement of the gland is uniform, but more commonly one of the lobes, generally the right, is the larger. In some rare instances the disease has been noticed to be limited almost entirely to the isthmus which connects the two lobes of the gland. The growth is unattended with pain, and is not inconsistent with a fair measure of health.

Goitre is a marked example of an endemic disease. There are few parts of the world where it is not found prevailing in certain localities, these being for the most part valleys and elevated plains in mountainous districts. The wide distribution of this disease has naturally led to extensive inquiry and to abundant speculation as to its origin. It is unnecessary to mention the numerous theories which have been advanced on the subject. Many of these have already been referred to under *CRETINISM* (q.v.). The most generally accepted view among physicians is that which ascribes the malady to the use of drinking water impregnated with the salts of lime and magnesia, in which ingredients the water of goitrous districts would appear always to abound. This theory alone, however, is inadequate, as is evident from the often-observed fact that in localities not far removed from those in which goitre prevails, and where the water is of the same chemical composition, the disease may be entirely unknown. Hence among the best authorities the tendency now is to regard goitre as the result of a combination of causes, among which local telluric or malarial influences concur in an important manner with those of the drinking water in developing the disease. It is noteworthy that goitre can often be cured by removal from the district where it prevails, as also that it is apt to be acquired by previously healthy persons who settle in goitrous localities; and it is only in such places that the disease exhibits any hereditary tendencies.

In the treatment of goitre the first step is the removal, if possible, of the patient from the affected locality, and attention to general hygienic rules. The employment of burnt sponge as a cure for goitre was in general use until Dr Coindet of Geneva showed that its acknowledged virtues were in all probability due to the iodine which it contained, and proposed as a substitute this latter agent in a pure state. Dr Coindet's views were amply borne out, and iodine and its preparations have been universally adopted as the most potent remedy in this disease, and have superseded all other medicines. Small and gradually increased doses of the drug, either in the form of iodide of potassium or what is known as Lugol's solution appear to be the best methods of administration. The external application of iodine to the goitre, in the form of liniment or ointment, is of scarcely less value than its internal employment, and would seem to be sometimes capable of effecting a cure alone, as is evident from the method of treatment adopted with singular success in India and originally proposed by the late Major Holmes. This consists in applying to the goitre, by means of a spatula, an ointment of biniodide of mercury for about ten minutes soon after sunrise, and placing the patient with his goitre exposed to rays of the sun for six or seven hours. Blister

ing of the surface generally follows, a second application of the ointment is made, and the patient sent home. This is often found sufficient to effect the cure, but the treatment can, if necessary, be repeated.

The name "Exophthalmic Goitre" is applied to another form of enlargement of the thyroid gland, differing entirely in its pathological connexions from that above described. In this affection the bronchocele is but one of three phenomena, which together constitute the typical characteristics of the disease, viz., palpitation of the heart and great vessels, enlargement of the thyroid gland, and protrusion of the eyeballs. This group of symptoms is generally known by the names of Graves's disease or Von Basedow's disease, in reference to the physicians by whom the malady was originally recognized and described. Although occasionally observed in men, this affection occurs much more commonly in females and in comparatively early life. It is generally preceded by ill health in some form, more particularly impoverishment of blood, and nervous or hysterical disorders, and is occasionally seen in cases of organic heart-disease. It has sometimes been suddenly developed as the effect of fright or violent mental emotion. The first of the symptoms to appear is usually the palpitation of the heart, which is aggravated by the slightest exertion, and may be so severe as not only to shake the whole frame but even to be audible at some distance from the patient. An uncomfortable sensation of throbbing is felt throughout the body, and many of the larger blood-vessels are seen to pulsate strongly like the heart. The enlargement of the thyroid gland generally comes on gradually, and rarely increases to any great size, thus differing from true goitre, as originally noticed by Dr Graves. The enlarged gland is of soft consistence, and communicates a thrill to touch from its dilated and pulsating blood-vessels.

Accompanying the goitre a remarkable change is observed in the appearance of the eyes, which attract attention by their prominence and the startled expression thus given to the countenance. In extreme cases the eyes protrude from their sockets to such a degree that the eyelids cannot be closed, and injury may thus arise to the constantly exposed eyeballs. Apart from such risk, however, the vision is rarely affected in this disease. Much difference of opinion prevails as to the immediate cause of the protrusion of the eyes, but it is generally ascribed to the increase of the fatty tissue and distension of the blood-vessels of the orbits. It occasionally happens that in undoubted cases of the disease one or other of the three above-named phenomena is absent, generally either the goitre or the exophthalmos. The palpitation of the heart is the most constant symptom. Sleeplessness, irritability, disorders of digestion, diarrhoea, and uterine derangements are common accompaniments.

The pathology of exophthalmic goitre is still somewhat uncertain, but there are strong reasons to believe that it is

essentially a nervous ailment, and that the symptoms depend on a morbid state of the sympathetic nerve in the neck, which is well known to play an important part in the vaso-motor functions—that is, in controlling the action of the heart and regulating the calibre of the blood-vessels. In numerous instances of exophthalmic goitre a diseased state of this nerve has been found *post mortem*, although it must be admitted that in some cases no morbid change could be detected. The experiments of Bernard, Brown-Sequard, Schiff, and others upon the functions of the sympathetic nerve lend strong support to this view of the pathology of the disease. Exophthalmic goitre is not directly a fatal malady, but, on the other hand, complete recovery is a less frequent result than partial improvement, the patient continuing to suffer from chronic ill-health. The disturbed condition of the heart's action leads in some instances to permanent disease of that organ in the form of dilatation of its cavities. In the treatment of exophthalmic goitre the most successful results have been attained by the use of digitalis, which has the effect of giving tone to the heart and contracting the dilated blood-vessels. The tincture of digitalis, in doses of 5 to 10 drops twice or thrice daily, is perhaps the best form of administration. Where *anaemia* is present iron is indicated, and may be combined with the digitalis, although in some cases it is found to be unsuitable. In allaying the palpitation benefit is said to have frequently followed the application of ice to the cardiac region as well as to the thyroid gland. Iodine, which is so valuable in cases of true goitre, is generally admitted to be of no service in this disease, and is rather held to be injurious. (J. O. A.)

GOLCONDA, a fortress and ruined city, situated in the Nizám's Dominions, 7 miles west of Hyderabad city. In former times Golconda was a large and powerful kingdom of the Deccan, which arose on the downfall of the Bâhmani dynasty, but was subdued by Aurungzebe in 1687, and annexed to the dominions of the Delhi empire. The fortress of Golconda, situated on a rocky ridge of granite, is extensive, and contains many enclosures. It is strong and in good repair, but is commanded by the summits of the enormous and massive mausolea of the ancient kings about 600 yards distant. These buildings, which are now the chief characteristics of the place, from a vast group, situated in an arid, rocky desert. They have suffered considerably from the ravages of time, but more from the hand of man, and nothing but the great solidity of their walls has preserved them from utter ruin. These tombs were erected at a great expense, some of them being said to have cost as much as £150,000. Golconda fort is now used as the nizám's treasury, and also as the state prison. The diamonds of Golconda have obtained great celebrity throughout the world; but they were merely cut and polished here, being generally found at Partial, near the south-eastern frontier of the nizám's territory.

## G O L D

THE colour, lustre, and power of resisting oxidation, which this metal possesses, have caused it to be valued from the earliest ages. Allusions to gold are frequent in the Old Testament, and the refining of the precious metals by cupellation seems to have been a favourite illustration with the Jewish poets.<sup>1</sup> Jewellery and vessels found in Egyptian tombs afford evidence of the perfection attained in working gold at a period earlier than the government of Joseph,<sup>2</sup> and drawings on tombs of about this epoch clearly indicate the method of conducting the operations of washing, fusing, and weighing the metal.

Excavations in Etruria have brought to light beautiful ornaments of gold, enriched with minute grains of the metal, the workmanship of which was unrivalled until Castellani studied and revived the methods employed by Etruscan artists.<sup>3</sup> The Greeks were familiar with natural alloys of silver and gold named *electrum*, rough nuggets of which were frequently stamped, and formed the earliest coins in Lydia.<sup>4</sup> The colour of this electrum is pale yellow to yellowish white, and it contains from 20 to 40 per cent. of silver.

<sup>1</sup> Percy's *Metallurgy of Lead*, p. 177.

<sup>2</sup> Jacquemart, *History of Furniture*, translation, p. 331.

<sup>3</sup> *Archæological Journal*, 1861, p. 365.

<sup>4</sup> "Notes on the Ancient Electrum Coins," by Barclay V. Head, *Numismatic Chronicle*, part iv., 1875, p. 245.

With regard to the history of the metallurgy of gold, it may be mentioned that, according to Pliny, mercury was employed in his time both as a means of separating the precious metals and for the purposes of gilding. Vitruvius also gives a detailed account of the means of recovering gold, by amalgamation, from cloth into which it had been woven.

*Properties.*—Gold is the only metal of a yellow colour, which is, however, notably affected by small quantities of other metals; thus the tint is sensibly lowered by small quantities of silver, and heightened by copper. The surface colour of particles of gold is often apparently reddened by translucent films of brown iron ore. It is nearly as soft as lead. The *hardness* varies, however, with the composition. Crystallized specimens from Oregon and Fraser River, containing respectively 835 and 910 parts of gold in 1000, are slightly harder than calc spar but sensibly softer than fluor spar, or much harder than the pure metal. When pure, gold is the most *malleable* of all metals. One grain may be beaten into leaves which cover a surface of 56 square inches, and are only  $\frac{1}{251000}$  of an inch thick. Faraday has shown that the thickness of gold leaves may be still further reduced by floating them on a dilute solution of cyanide of potassium. When very thin, leaf gold appears yellow by reflected and green by transmitted light. If, however, certain gold films are heated, the light transmitted is ruby red; the pressure of a hard substance on the film so changes its state of aggregation that green light is again transmitted.<sup>1</sup> The metal is extremely *ductile*; a single grain may be drawn into a wire 500 feet in length, and an ounce of gold covering a silver wire is capable of being extended more than 1300 miles. Gold can readily be welded cold, and thus the finely divided metal, in the state in which it is precipitated from solution, may be compressed between dies into discs or medals. According to G. Rose,<sup>2</sup> the *specific gravity* of gold in the finely divided state in which it is precipitated from solution by oxalic acid is 19.49. The specific gravity of cast gold varies from 18.29 to 19.37, and by compression<sup>3</sup> between dies the specific gravity may be raised from 19.37 to 19.41; by annealing, however, the previous density is to some extent recovered, as it then is found to be 19.40. Its *atomic weight* is variously given as follows:—196.67 (Berzelius), 196.3 (Levol), 196.5 (Wurtz), 196.0 (Watts). The number adopted in this work (CHEMISTRY, vol. v. p. 528) is 196.2. Different observers have given the following temperatures as its *melting point*:—1425° C. (Daniell), 1200° C. (Pouillet), 1380° C. (Guyton de Morveau). Riemsdijk,<sup>4</sup> after comparing the several results, concludes that it may be considered to be 1240° C. The *electric conductivity* is given by Matthiessen as 73.99 at 15.1° C., pure silver being 100; this depends greatly on its degree of purity,—the presence of a few thousandths of silver lowering its conductivity by 10 per cent. The *specific resistance* of the metal in electromagnetic measure, according to the centimetre-gramme-second system of units, is 2154. Its *conductivity for heat* is 53.2 (Wiedemann and Franz), pure silver being 100. Its *specific heat* is 0.324 (Regnault). Its *coefficient of expansion* for each degree between 0° and 100° C. is 0.000014661, or for gold which has been annealed 0.000015136 (Laplace and Lavoisier). The *specific magnetism* of the metal is 3.47 (Becquerel). Details as to its *tenacity* and *rigidity* are given in the article ELASTICITY. With regard to its *volatility*, Gasto Claveus<sup>5</sup> states that he placed an ounce of pure gold in an earthen

vessel in that part of a glass-house where the glass is kept constantly melted, and retained it in a state of fusion for two months without the loss of the smallest portion of its weight. Kunkel describes a similar experiment, which was attended with the same result. Homberg,<sup>6</sup> however, observed that when a small portion of gold is kept at a violent heat, part of it is volatilized. Both Macquer and Lavoisier showed that when gold is strongly heated, fumes arise which gild a piece of silver held in them. Its volatility has also been studied by Elsher, and, in the presence of other metals by Napier.<sup>7</sup> Hellot affirms that when an alloy of 7 parts of zinc and 1 part of gold is heated in air, the whole of the gold rises in the fumes of oxide of zinc which are produced. Gold is dissipated by sending a powerful charge of electricity through it when in the form of leaf or thin wire. In the gold *spectrum* Huggins has observed twenty-three lines, and the wave lengths of the three most important of these are 5231, 5835, and 6276 respectively. Some preliminary observations on the spectrum of the vapour at the temperature of the oxy-hydrogen flame, made by Lockyer and Roberts,<sup>8</sup> showed that there was a distinct absorption both at the blue and at the red end.

The solvents for gold are given in the article CHEMISTRY, vol. v. p. 529. It may be added that finely-divided gold dissolves when heated with strong sulphuric acid and a little nitric acid. Dilution with water, however, precipitates the metal as a violet or brown powder from the solution so obtained. Gold is also attacked when strong sulphuric acid is submitted to electrolysis with a gold positive pole.<sup>9</sup> W. Skey has shown<sup>10</sup> that in substances which contain small quantities of gold, the precious metal may be removed by the solvent action of a tincture of iodine or bromine in water. Filter paper soaked with the clear solution is burnt, and the presence of gold is indicated by the colour of the ash.

*Occlusion of Gas by Gold.*—Graham has shown<sup>11</sup> that gold is capable of occluding 0.48 of its volume of hydrogen, and 0.20 of its volume of nitrogen. Varrentrapp has also pointed out that "cornets" from the assay of gold may retain gas if they are not strongly heated. Artificial crystals of gold may be formed when the molten metal is slowly cooled.

*Occurrence and Distribution.*—Gold is found in nature chiefly in the metallic state, or as native gold, and less frequently in combination with tellurium, lead, and silver, forming a peculiar group of minerals confined to a few localities in Europe and America. These are the only certain examples of natural combinations of the metal,—the minute although economically valuable quantity often found in pyrites and other sulphides being probably only present in mechanical suspension, although for practical purposes it may be spoken of as combined. The native metal occurs tolerably frequently in crystals belonging to the cubic system, the octahedron being the commonest form, but other and complex combinations have been observed. Owing to the softness of the metal, large crystals are rarely well defined, the points being commonly rounded. In the irregular crystalline aggregates branching and moss-like forms are most common, and in Transylvania thin plates or sheets with diagonal structures are characteristic. These have recently been shown by Vom Rath to be repeated combinations of distorted tetrahexahedra. During the preparation of a mass of pure gold in the Mint at London, some fine crystals which appear to be aggregations of octahedra were obtained; and dendritic crystals of gold,

prepared artificially, have been described by Chester. It is possible also to obtain gold in crystals by heating its amalgam; according to Knauff, an amalgam of 1 part of gold with 20 parts of mercury is maintained at a temperature of 80° C for eight days. It is then heated to 80° C. with nitric acid of specific gravity 1.35, when dull crystals will be left, which become brilliant when more strongly heated. More characteristic, however, than the crystallized are the irregular forms, which, when large, are known as "nuggets" or "pepites," and when in pieces below  $\frac{1}{4}$  to  $\frac{1}{2}$  ounce weight as gold dust, the larger sizes being distinguished as coarse or nuggety gold, and the smaller as gold dust proper. Except the larger nuggets, which may be more or less angular, or at times even masses of crystals, with or without associated quartz or other rock, gold is generally found bean-shaped or in some other flattened form, the smallest particles being scales of scarcely appreciable thickness, which, from their small bulk as compared with their surface, subside very slowly when suspended in water, and are therefore readily carried away by a rapid current. These form the "float gold" of the miner. The physical properties of native gold are generally similar to that of the melted metal and its alloys as described above. The composition varies considerably in different localities, as shown in the following table:—

Of the minerals containing gold the most important are sylvanite or graphic tellurium, of composition ( $\text{AgAu}$ ) $\text{Te}_2$ , with 24 to 26 per cent.; calaverite,  $\text{AuTe}_2$ , with 42 per cent.; and nagyagite or foliate tellurium, of a complex and rather indefinite composition, with 5 to 9 per cent. of gold. These are confined to a few localities, the oldest and best known being those of Nagyag and Ofenbanya in Transylvania; but latterly they have been found in some quantity at Red Cloud, Colorado, and in Calaveras county, California—the nearly pure telluride of gold, calaverite, being confined to these places.

The minerals of the second class, usually spoken of as auriferous, or containing gold in sensible quantity, though not to a sufficient amount to form an essential in the chemical formulæ, or even in many instances to be found in the quantities ordinarily operated upon in analyses, are comparatively numerous, including many of the metallic sulphides. Prominent among these are galena and iron pyrites,—the former, according to the observations of Percy and Smith, being almost invariably gold-bearing to an extent that can be recognized in operating upon a pound weight

of the lead smelted from it, the proportion increasing to some extent with the amount of silver.<sup>1</sup> The second is of greater practical importance, being in some districts exceedingly rich, and, next to the native metal, is the most prolific source of gold. Magnetic pyrites, copper pyrites, zinc blende, and arsenical pyrites are other and less important examples,—the last constituting the gold ore formerly worked in Silesia. A native gold amalgam is found as a rarity in California, and bismuth from South America is sometimes rich in gold. Native arsenic and antimony are also very frequently found to contain gold and silver.

The association and distribution of gold may be considered under two different heads, namely, as it occurs in mineral veins, and in alluvial or other superficial deposits which are derived from the waste of the former. As regards the first, it is chiefly found in quartz veins or reefs traversing slaty or crystalline rocks, usually talcose or chloritic schists, either alone, or in association with iron, copper, magnetic and arsenical pyrites, galena, specular iron ore, and silver ores, and more rarely with sulphide of molybdenum, tungstate of calcium, bismuth, and tellurium minerals. Another more exceptional association, that with bismuth in calcite from Queensland, was described by the late Mr Daintree. In Hungary, the Urals, and northern Peru, silicates and carbonates of manganese are not uncommonly found in the gold and silver bearing veins. In the second or alluvial class of deposits the associated minerals are chiefly those of great density and hardness, such as platinum, osmiridium, and other metals of the platinum group, tinstone, chromic, magnetic, and brown iron ores, diamond, ruby, and sapphire, zircon, topaz, garnet, &c., which represent the more durable original constituents of the rocks whose disintegration has furnished the detritus. Native lead and zinc have also been reported among such minerals, but their authenticity is somewhat doubtful.

The distribution of gold-bearing deposits is world-wide; although the relative importance of different localities is very different, their geological range is also very extensive. In Europe the principal groups of veins are in slaty or crystalline schists, whose age, when it can be determined, is usually Palæozoic, Silurian, Devonian, or Carboniferous, and less commonly in volcanic formations of Tertiary age. The alluvial deposits, being more extensive, are less intimately connected with any particular series of rocks. Few of either are, however, of much importance as compared with the more productive deposits of America and Australia. In the United Kingdom gold-bearing quartz veins were worked during the Roman occupation at Ogofau, near Llanpumpsant, in Carmarthenshire; and in the year 1863 as much as 5300 oz. was produced from similar veins in Lower Silurian slates at Vigra and Clogau mines, near Dolgelly. In 1875 the mine was reopened, and in 1878 it produced 720 oz. Tetradyte, native bismuth, and several other characteristic associates of gold were also found in small quantity. In Cornwall small pieces of native gold have at intervals been found in alluvial or stream tin works; and similar but more important finds have been made in the granite district of Wicklow, and more recently at Helmsdale, in Sutherlandshire. The largest nugget of British origin weighs under 3 oz.

On the continent of Europe the great rivers originating in the crystalline rocks of the Alpine region, such as the Rhine and Danube, are slightly auriferous in their alluvial deposits in several places; but the proportion of gold is extraordinarily minute, so that the working is only carried on by gipsies, or by the local peasantry at irregular intervals, the return for the labour expended being very small. The same remark applies to the Rhone and its

<sup>1</sup> *Phil. Mag.*, vii., 1854, p. 126.

affluents, and the rivers of the central granitic mass of France. In the Austrian Alps the gold quartz mines at the Rathausberg, near Gastein, at a height of about 9000 feet above the sea-level, and at Zell, in Tyrol, are of interest historically as having developed the system of amalgamation in mills, although they are economically of small importance at present. On the Italian side, in the Valanzasca and Val Toppa above Lago Maggiore, a group known as the Pestarena mines have yielded from 2000 to 3000 ounces annually for several years past; and more recently a discovery of great interest of a highly auriferous copper ore has been made at Ollomont in the Val d'Aosta. In Hungary the gold-bearing veins of Schemnitz occur in greenstones and trachytes of Tertiary age, the most powerful example, the *Spitaler-gang*, being filled with a mixture of quartz and brown iron ore known as zinnopal, and containing gold associated with silver ores, galena, and pyrites. In Transylvania, at Nagyag, the gold-bearing tellurium minerals previously noticed are found in small veins traversing greenstone trachyte. These are often very thin, as low as  $\frac{1}{16}$ th to  $\frac{1}{8}$ th of an inch, but each is carefully traced out, the rock being impregnated with gold and silver to a certain depth on each side. At Vöröspatak, another Transylvanian locality, gold with a very large proportion of silver and associated with gypsum is worked in veins traversing a Tertiary sandstone, being almost the only known instance of such a mode of occurrence.

The Russian empire has the largest gold production among the countries of the Old World, most of the produce, however, being derived from its Asiatic territories. The more important localities are situated on the eastern slope of the Ural chain, extending in a nearly north and south line for more than 600 miles from 51° to 60° N. lat. The chief centres are Miask (55° N.), Kamensk (56° 30' N.), Berezovsk (57° N.), Nijne Tagilsk (58° N.), and Bogoslovsk (60° N.), the known deposits, which include both veins and alluvial mines, extending for about one degree farther north. The geological age of the Ural veins is not very well defined—strata of the Silurian, Devonian, and Carboniferous periods, which form regular parallel alternations on the European slope, being present on the Asiatic side, but in much disturbed and contorted positions, in association with plutonic rocks, diorite, diabase, and granite, with which the gold veins are intimately connected. The latter are therefore of post-Carboniferous and probably of Permian date. At Berezovsk the mines cover an area of about 25 square miles, mainly composed of talcose, chloritic, and clay slates, vertical or sloping at high angles, and penetrated by dykes of beresite, a fine grained rock made up of quartz and white mica with some felspar and pyrites, the latter usually transformed into brown iron ore. These dykes, which have a general north-and-south direction are vertical, and are from 20 to 70 feet and upwards in thickness, are traversed perpendicularly to their direction by veins of quartz from the thinnest string to a maximum of 3½ or 4 feet thick, in which gold is associated with brown iron ore or ochres, resulting from the decomposition of pyrites. The workings being essentially shallow, none of the associated sulphides, galena, disulphide of copper, &c., have as yet been found, as a rule, to be gold-bearing. The valuable parts of the veins are almost entirely restricted to the beresite dykes. The richest of the Ural mines are those of Smolensk, near Miask, and Ouspensk, near the village of Katchkar, in 52° N. The alluvial deposits which, though called sands, are but very slightly sandy clays, extend to the north beyond the inhabited regions, and to the south into the Cossack and Bashkir countries. The most valuable diggings are in the district of Miask, where the largest nuggets have been found, and in the Katchkar, which are remarkable for the great number of gems, pink topazes,

emeralds, &c., found in connexion with the gold. Magnetite, quartz, and platinum are very common in all the Ural gold sands; less common are hematite, titaniferous and chromic iron, pyrites, garnet, and, least of all, zircon, kyanite, and diamond. These alluvial deposits are of later Tertiary age, some of them containing traces of prehistoric human work; others are post-Pliocene, with the remains of the mammoth, tichorrhine, rhinoceros, and other mammalian fossils. Somewhat similar conditions prevail in the alluvial gold region of the Altai. Besides the veins and alluvial deposits, the Ural rocks, such as serpentine, diorite, beresite, agrairite, &c., are at times auriferous.

The gold deposits of the Caucasus, though immortalized in the tradition of Jason and the Argonauts, are now entirely abandoned, the last attempt at working them having been suspended in 1875.

In India gold is obtained in small quantities by native gold washers in various parts of the highlands of southern Bengal, and more recently quartz veins and alluvial deposits of considerable promise have been discovered in the district of Wynaad, in the southern part of the Madras presidency.

On the Atlantic slopes of North America the chief gold-bearing localities are on the Chaudière river, near Quebec, and in Nova Scotia. In both instances the quartz veins worked are contained in slates belonging to the Quebec group of the Lower Silurian period, those of the latter province being specially remarkable for their quasi-stratified character, as they penetrate the slates at a very low angle of inclination, and have been folded and corrugated together with the containing rocks by subsequent disturbances. Other deposits of old geological periods are found in Tennessee and North Carolina.

On the Pacific side of America gold is found under very different conditions, and on a much larger scale than on the Atlantic side. The whole distance from Mexico to Alaska may be said to be more or less auriferous, the most extensive deposits being in the great north-and-south valley of the Sacramento, which runs parallel to the coast, between the so-called Coast Mountains and the Sierra Nevada, the latter being distinguished further to the north in the Cascade range. Others of less extent are known in the Klamath, Columbia, and Fraser river basins; they extend in the last two far back into the interior, to the region between the Cascade range and the Rocky Mountains. In many of these valleys alluvial deposits are developed to an extent unparalleled elsewhere, the river channels being bordered by banks or benches of gravel and sand, rising in terraces to considerable heights on the flanks of the hills. For example, at the Methow a tributary of the Columbia, there are sixteen lines of such terraces, the highest about 1200 feet above the river; and at Colville, on the Columbia, traces of old terraces, much degraded by frost and rain, are seen at 1500 feet above the river. These gravels, which are of Pliocene and more recent origin, are in many places, though very unequally, auriferous, the richest points being found in the bars or shingle banks of the river after the summer floods, and in the channels of the smaller tributary streams, where the poorer material has been partially enriched by a process of natural washing. The most extensive, or rather the best known because most completely explored, deposits of this class are those of the Upper Sacramento valley, in California (see vol. iv. p. 701).<sup>1</sup> Others of considerable importance are worked in the Cariboo district on the Upper Fraser river, yielding very coarse gold. Another discovery of a singular character, the produce being a regular gold gravel, was made some years back at Salmon river in Oregon, but the deposit, though exceedingly rich, was soon exhausted. Gold-

<sup>1</sup> See also Whitney, *On the Auriferous Gravels of the Sierra Nevada*, Cambridge, U.S., 1879.

bearing quartz veins are also common over a large part of California, notably in Grass Valley (vol. iv. p. 702), in strata that are supposed to be of Triassic age, the associated minerals being iron and arsenical pyrites, galena, &c. In Calaveras county, tellurium ores like that of Transylvania are characteristic of the gold veins. In the adjacent States of Nevada and Colorado, gold is so intimately associated with silver ores that it is for the most part only obtained from the ultimate process of refining the reduced silver. The same remark applies to the most of the mines of Mexico, and on the south-west coast of America, in Peru, Bolivia, and Chili. See SILVER.

Very rich gold quartz has been brought from Carabaya on Lake Titicaca; and recently considerable deposits both alluvial and in veins have been opened at Caratal in Venezuela and at St Elie in French Guiana, which are interesting as proving the actual existence of Raleigh's Eldorado.

In Brazil the principal gold mines are upon veins in clay slate, and a peculiar class of rocks known as Jacotinga or Itabirite, and which are mixtures of quartz, chlorite, and specular iron ore, the latter often occurring in large mirror-like crystals several inches across. The gold occurs almost entirely in pyritic minerals, being most abundant in ordinary iron pyrites, and less so in magnetic and arsenical pyrites, free gold being rarely seen. See BRAZIL, vol. iv. p. 224.

In Africa the chief gold-bearing localities are on the west coast—gold dust derived from alluvial washings forming an article of export from many of the trading stations along the Guinea coast. Latterly, alluvial deposits have been worked in the mountains of Transvaal, in the Leydenburg district (25° S. lat., 31° E. long.), producing coarse nuggetty gold in masses up to 11 lb weight, and in a few cases gold-bearing quartz has been found in veins in talcose schist and quartzite, closely associated with eruptive masses of diorite. The age of these rocks is considered by Dunn<sup>1</sup> to be Silurian or Devonian, and the observed phenomena to be similar to those generally observed in Australia. The upper valley of the Nile produces a little gold in Abyssinia and Nubia, the latter being the land of gold of the old Egyptians. Very extensive ancient mines have been described by Linant Bey in the district known as Attaki or Allaki on the Red Sea, situated about 120 miles back from Ras Elba, the headland midway between Borenice and Sauwakin. These are probably the same mines that were described by Diodorus Siculus, and one of the oldest topographical documents known, a map or itinerary of the route to them from the Nile, is preserved at Turin. In the reign of Setes I., of the 19th dynasty, wells were opened along this route, in order that the mines, that were then of very great antiquity, might be reopened.<sup>2</sup> Similar ancient gold mines have recently been discovered by Burton in the land of Midian, on the east coast of the Gulf of Akaba.

The gold districts of Australia cover a very considerable area, extending from the east side of the continent for about 20° of latitude (18° to 38° S.), the more important deposits being those of Victoria in the south. The principal districts are in Victoria,—Ballarat, Castlemaine, and Sundhurst, lying west and north from Melbourne, and Beechworth near the Murray river to the north-east. In New South Wales the gold fields are scattered over the entire length of the colony from north to south, the more important districts lying between the 32d and 36th parallels of S. lat. on the western side of the Australian cordillera, on the upper tributaries of the Macquarie and Lachlan rivers, the centre being about the town of Bathurst. This is known as the western district. Another group, known as

the northern district, is on the eastern side of the mountains near the Queensland boundary, in 29° S., Rocky River being the principal locality; while the southern district includes Braidwood, Adelaide, Tumbarumba, and other localities near the Murray river. In Queensland the chief localities are, commencing on the south, Gympie and Kilkevan near Maryborough, 26° S. lat.; a group extending about 50 miles north and south of Rockhampton, in 21° 30' S. lat., all near the coast; Eastern River, Hurley, and Peak Downs, about 300 miles inland on the 23d parallel; and Clomenny and Gilbert on a stream running into the Gulf of Carpentaria, besides numerous others. In all those localities two principal kinds of deposits are observed, namely, auriferous quartz veins traversing slates of Silurian and Devonian age, which are in intimate relation with masses of diorite and other eruptive rocks; and gold-bearing drifts of Miocene or even newer Tertiary date, derived from the degradation of the older strata. According to Daintree,<sup>3</sup> no auriferous vein of any kind has been found in any Secondary or Tertiary strata, or in the igneous rocks erupted through any such newer formations; and as a result of his experience the same observer gives the following as the modes of occurrence of gold in Australia:—(1) In pyritic diorites and felstones in Queensland, and their alluvial drifts; (2) in pyritic granites in New South Wales; (3) in drifts from auriferous serpentine in Queensland, also in the two northern colonies; (4) in more or less regular veins with quartz and calc spar in the preceding rocks; (5) in quartz and other veins in Devonian and Upper Silurian strata in proximity to similar igneous rocks, which is the general character of the Victoria quartz veins; (6) in veins of metamorphic rocks of unknown age in Queensland; and (7) in quartz veins in Lower Silurian strata, without any apparent connexion with igneous masses. The latter occur only in Victoria, and are of comparatively minor importance. In the northern territory of South Australia, alluvial gold mining has recently been developed to a considerable extent in the neighbourhood of Port Darwin in the Gulf of Carpentaria, the export being from 2000 to 3000 oz. monthly.

*Statistics.*—There are no means of stating exactly the total gold produce of the world for any particular year, as in many of the larger producing countries no systematic returns are obtained, and in others where such returns are collected their publication is often delayed for a considerable time. The following figures, mostly derived from a recent statistical work, A. Soetbeer, *Eidmetall-Produktion*, 1879, with some additions from late official sources, will give some idea of the relative importance of the different countries. Previous to 1837 the first place was held by Russia, and the estimated average annual yield from all sources was, in the decennial period 1841-50, 1,760,500 ounces.

The contributions of the different countries are as follows:—

|                       | oz.                          | oz.             | oz.           |

*Proportion of Gold in Deposits.*—A rich gold-bearing deposit is quantitatively very different from one to which the same term is applied when containing ores of other metals. In the latter the useful material must as a rule form a considerable proportion—one or more parts in a hundred—of the mass; while in the former, owing to the superior value of the product, it rarely attains as much as 1 per cent., and is generally very much less, the amount of gold contained in easily worked alluvial deposits being often extremely small. For example, the yield of the Siberian gold washings ranges from 12 grains to 1 dwt. 12 grains per ton;<sup>1</sup> while in the lodes, which are more difficult and expensive to work, the proportion is about 8 dwts. per ton. In the alluvial washings of California it is estimated at about two shillings worth, equal to about  $\frac{1}{10}$ th of an ounce, per ton of gravel. In Australia the alluvial ground worked in the colony of Victoria in 1878 is returned as averaging 25 grains (1 dwt. 1 gr.) per ton, or about double the above quantity.

In vein mining, which is more difficult and costly, a larger yield is necessary, but probably 5 dwts., or about £1 in value per ton, will in most places represent paying quantities from quartz containing free gold, *i.e.*, not associated with pyrites. The proportional yield and quantities of the different kinds of auriferous materials treated in the colony of Victoria during the last three months of 1878 were—

|                                                                | Tons.   | Yield per ton. |
|----------------------------------------------------------------|---------|----------------|
|                                                                |         | oz. dwt. gr.   |

In the less tractable minerals, such as arsenical pyrites occurring in the lower portions of the veins, as much as  $1\frac{1}{2}$  to 3 oz. may be required for profitable working. When associated with the ores of other metals, such as silver, lead, and copper, the extraction of the gold is in most cases an incidental and final operation in their metallurgical treatment, and may therefore be best considered in the articles on these metals.

*Mining.*—The various deposits of gold may be divided into two classes—"veins" and "placers." The vein mining of gold does not greatly differ from that of similar deposits of metals. It will only be necessary to refer here to certain details of the extraction of gold in such cases. In the placer or alluvial deposits, the precious metal is found usually in a water-worn condition imbedded in earthy matter, and the method of working all such deposits is based on the disintegration of the earthy matter by the action of a stream of water, which washes away the lighter portions and leaves the denser gold. In alluvial deposits the richest ground is usually found in contact with the "bed rock"; and, when the overlying cover of gravel is very thick, or, as sometimes happens, when the older gravel is covered with a flow of basalt, regular mining by shafts and levels, as in what are known as tunnel-claims, may be required to reach the auriferous ground. In the early days of gold washing in California and Australia, when rich

alluvial deposits were common at the surface, the most simple appliances sufficed; the most characteristic being the "pan," a circular dish of sheet-iron with sloping sides about 13 or 14 inches in diameter. The pan, about two-thirds filled with the "pay dirt" to be washed, is held in the stream or in a hole filled with water. The miner, after separating the larger stones by hand, imparts a gyratory motion to the pan by a combination of shaking and twisting movements which it is impossible to describe exactly, so as to keep its contents suspended in the stream of water, which carries away the bulk of the lighter material, leaving a black residue consisting of magnetic iron ore and other heavy minerals, together with any gold which may originally have been present in the mass. The washing is repeated until enough of the enriched sand is collected, when the gold is finally recovered by careful washing or "panning out" in a smaller pan. In Mexico and South America, instead of the pan, a wooden dish or trough, variously shaped in different districts, and known as "batea," is used.

The "cradle," a simple appliance for treating somewhat larger quantities, varies in length from 3 feet 6 inches to 7 feet, but the shorter length is that usually adopted. Its nature will be evident from fig. 1, in which *a* is a movable hopper with a perforated bottom of sheet-iron in which the "pay dirt" is placed. Water is poured on the dirt, and the rocking motion imparted to the cradle causes the finer particles to pass through the holes in the hopper on to the screen *b*, which is of canvas, and thence to the base of the cradle, where the auriferous particles accumulate on the transverse bars of wood *c*, called "riffles." Washing by the cradle, which is now but little used except in preliminary workings, is tedious and expensive.

FIG. 1.—Cradle.

The "tom" is a sort of cradle with an extended sluice placed on an incline of about 1 foot in 12. The upper end contains a perforated riddle plate which is placed directly over the riffle box, and under certain circumstances mercury may be placed behind the riffles. Copper plates amalgamated with mercury are also used when the gold is very fine, and even in some instances amalgamated silver coins have been used for the same purpose. Sometimes the stuff is disintegrated with water in a "puddling machine," which is used, especially in Australia, when the earthy matters are tenacious and water scarce. The machine frequently resembles a brickmaker's wash-mill, and is worked by horse or steam power.

In workings on a larger scale, where the supply of water is abundant, as in California, sluices are generally employed. They are shallow troughs about 12 feet long, about 16 to 20 inches wide, and 1 foot in depth. The troughs taper

FIG. 2.—Sluice.

slightly so that they can be joined in series, the total length often reaching several hundred feet. The incline of the sluice varies with the conformation of the ground and the tenacity of the stuff to be washed, from 1 in 16 to 1 in 8.

Fig. 2 represents one of the simplest forms of sluice as

<sup>1</sup> 1 dwt per ton corresponds to 1 part in 653,333 by weight, and about 1 in 5 or 6 millions by volume.

used in river diggings in the north-west of America. A rectangular trough of boards, whose dimensions depend chiefly on the size of the planks available, is set up on the higher part of the ground at one side of the claim to be worked, upon trestles or piers of rough stone-work, at such an inclination that the stream may carry off all but the largest stones, which are kept back by a grating of boards about 2 inches apart at *a*. The gravel, which in this particular instance is from 12 to 16 feet thick, and with an average breadth to the river of 25 to 30 feet, is dug by hand and thrown in at the upper end, the stones kept back being removed at intervals by two men with four pronged steel forks. The floor of the sluice is laid with riffles made of strips of wood 2 inches square laid parallel to the direction of the current (as at *b*, and in cross section at *c*), and at other points *d* with boards having transverse notches filled with mercury. These were known originally as Hungarian riffles. The bottom of the working, which is below the drainage level of the valley, is kept dry by a Chinese bucket pump *e*, attached to a rough undershot wheel driven by the current in the sluice. The sluice boxes are made in lengths, and united together spigot and faucet fashion, so that they may easily be removed and re-erected as the different parts of the claim are progressively exhausted.

In the larger and more permanent erections used in hydraulic mining, the upper ends of the sluices are often cut in rock or lined with stone blocks, the grating stopping the larger stones being known as a "grizzly." In order to save very fine and especially rusty particles of gold, so-called "under-current sluices" are used; these are shallow wooden tanks, 50 square yards and upwards in area, which are placed somewhat below the main sluice, and communicate with it above and below, the entry being protected by a grating so that only the finer material is admitted. These are paved with stone blocks or lined with mercury riffles, so that from the greatly reduced velocity of flow, due to the sudden increase of surface, the finer particles of gold may collect. In order to save finely-divided gold, amalgamated copper plates are sometimes placed in a nearly level position, at a considerable distance from the head of the sluice, the gold which is retained in it being removed from time to time. Sluices are often made double, and they are usually cleaned up,—that is, the deposit rich in gold is removed from them,—once a week. The gold is then recovered by "panning."

The application of a jet of water to the removal of auriferous gravels by the so-called hydraulic system of mining has already been noticed at vol. iv. p 701.<sup>1</sup> This method has for the most part been confined to the country of its invention, California, and the western territories of America, where the conditions favourable for its use are more fully developed than elsewhere,—notably the presence of thick banks of gravel that cannot be utilized by other methods, and abundance of water, even though considerable work may be required at times to make it available. The general conditions to be observed in such workings may be briefly stated as follows:—(1) The whole of the auriferous gravel, down to the "bed rock," must be removed,—that is, no selection of rich or poor parts is possible, (2) this must be accomplished by the aid of water alone, or at times by water supplemented by gunpowder; (3) the conglomerate must be mechanically disintegrated without interrupting the whole system; (4) the gold must be saved without interrupting the continuous flow of water; and (5) arrangements must be made for disposing of the vast masses of impoverished gravel.

The general appearance of an hydraulic gold working is seen in fig. 3, the water being brought from a ditch on the high ground, and through a line of pipes to the distributing box, whence the branch pipes supplying the

FIG. 3.—Hydraulic Gold Working.

three jets diverge. The stream issues through a nozzle resembling that of a fire engine (fig. 4), which is movable in a horizontal plane around the vertical axis *a*, and in a vertical plane on the spherical joint and centre *b*, so that the direction of the jet may be varied through considerable angles by simply moving a handle. The material of the bank, being loosened by blasting and the cutting action of the water, crumbles into holes, and the superincumbent mass, often with large trees and stones, falls into the lower ground. The stream, laden with stones and gravel, passes into the sluices, where the gold is recovered in the manner already described. Under the most advantageous conditions the loss of gold may be estimated at 15 or 20 per cent., the amount recovered representing a value of about two shillings per ton of gravel treated. The loss of mercury is about the same, from 5 to 6 cwt. being in constant use per mile of sluice. About 1 cwt. is added daily in at least two charges. The average half-yearly consumption is estimated at about one hundred flasks of 74 lb each, after allowing for the amount recovered in clearing up and distillation of the amalgam. The latter operation is performed at intervals of seven or fourteen days in the upper lengths of the sluice, and half-yearly in the lower parts.

Fig. 4.

The dressing or mechanical preparation of vein stuff containing gold is generally similar to that of other ores, except that the precious metal should be removed from the waste substances as quickly as possible, even although other minerals of value that are subsequently recovered may be present. This is usually done by amalgamation with mercury. In all cases the quartz or other vein stuff must be reduced to a very fine powder as a preliminary to further operations. This may be done in several ways, e.g., either (1) by the Mexican crusher or *arrastra*, in which the grinding is effected upon a bed of stone, over which heavy blocks of stone attached to cross arms are dragged by the rotation of the arms about a central spindle, motion being furnished by mules or other power, or (2) by the Chilean mill or *trapiche*, also known as the edge-runner, where the grinding stones roll upon the floor, at the same time turning about a central upright,—contrivances which are mainly used for the preparation of silver ores; but by far the largest proportion of the gold quartz of California and Australia is reduced by (3) the stamp mill, which is similar in principle to that used in Europe for the preparation of tin and other ores, but has

<sup>1</sup> Much valuable information on this subject will also be found in the *Fifth Annual Report of the United States Commissioners of Mining Statistics*, Washington, 1873, p. 390.

received special modification in many details Fig. 5 represents the ordinary Californian pattern of a stamp mill. The stamp is a cylindrical iron pestle faced with a chilled cast-iron shoe, removable so that it can be renewed when necessary, attached to a round iron rod or lifter, the whole weighing from 600 to 800 lb. The lift is effected by cams acting on the under surface of tappets *a*, and formed by cylindrical boxes keyed on to the stems of the lifter about one-fourth of their length from the top. As, however, the cams, unlike those of European stamp mills, are placed to one side of the stamp, the latter is not only lifted but turned partly round on its own axis, whereby the shoes are worn down uniformly. The bed or mortar *A* is of cast-iron. The height of lift may be between 8 and 10 inches, and the number of blows from 30 to 90 per minute. The stuff, previously broken to about 2 inch lumps in a Blake's rock breaker, is fed in through the aperture *n* at the back of the "battery box," a constant supply of water being given from the channel *k*, and mercury in a finely divided state is added at frequent intervals. The discharge of the comminuted material takes place through the aperture *l*, which is covered by a thin steel plate perforated with numerous

FIG. 5 — Stamp Mill.

slits about  $\frac{1}{16}$ th inch broad and  $\frac{1}{10}$ th to  $\frac{1}{8}$ th inch long, a certain volume being discharged at every blow and carried forward by the flushing water over the apron or table in front, *m*, covered by copper plates filled with mercury. Similar plates are often used to catch any particles of gold that may be thrown back, while the main operation is so conducted that the bulk of the gold may be reduced to the state of amalgam by bringing the two metals into intimate contact under the stamp head, and remain in the battery. The tables in front are laid at an incline of about 8 degrees, and are about 13 feet long; they collect from 10 to 15 per cent. of the whole gold; a further quantity is recovered by leading the sands through a gutter about 16 inches broad and 120 feet long, also lined with amalgamated copper plates, after the pyritic and other heavy minerals have been separated by depositing in catch pits and other similar contrivances.

When the ore does not contain any considerable amount of free gold, mercury is not, as a rule, used in the battery. The pulverized stuff is received upon blanket tables or sluices. These are inclined boards covered with coarse

woollen cloth or sacking. The heavier particles become entangled in the fibres of the cloth, while the lighter deposits are carried forward by the current. At intervals of a quarter to half an hour the surface of the blanket is completely covered, when it is removed, and its contents are washed off in a tub of water and reserved for further treatment. This consists of amalgamation, in a contrivance analogous to the Hungarian mill subsequently described, and subsequent treatment in pan amalgamators, somewhat similar to the *arrastra* in character, but with grinding surfaces of iron instead of stone.

At Schemnitz, in Hungary, quartz vein stuff containing a little gold, partly free and partly associated with pyrites and galena, is, after stamping in mills similar to those described above, but without rotating stamps, passed

FIG. 6.— Hungarian Mill.

through the so-called Hungarian gold mill, fig. 6. This consists of a cast-iron pan *a*, having a shallow cylindrical bottom *b*, holding 50 lb of mercury, in which a wooden runner *c*, nearly of the same shape as the inside of the pan, and armed below with several projecting blades, is made to revolve by gearing wheels placed either above, or, as in the figure, below. The connexion of the runner with the driving shaft is effected by the three-armed crutch shown in plan at *e*, which sits on the square part of the shaft. By means of set screws analogous to those of a flour mill, the runner is adjusted at such a height that the knives just clear the surface of the mercury. The stuff from the stamps arrives by the gutter *f*, and, falling through the hole in the middle of the runner, is distributed over the mercury, when the gold subsides in virtue of its superior density, while the quartz and lighter materials are guided by the blades to the circumference and are discharged at *g*, usually into a second similar mill, and sometimes to a third, placed at lower levels, and subsequently pass over blanket tables. The most advantageous speed is from 12 to 14 revolutions per minute. The action of this so-called mill is really more nearly analogous to that of a centrifugal pump, as no grinding action takes place in it. The amalgam is cleaned out about once a month. The average amount of gold collected from 50 tons of stuff stamped, is about 6 oz. in the mills, and in the subsequent dressing processes 1 lb of auriferous silver and 10 cwt. of lead. According to Rittinger, mercury that has been purified by distillation acts much more rapidly upon gold than such as has been saturated with the metal without losing its fluidity, although the amount that can be so dissolved is very small.

There are various forms of pan amalgamators of which space will not permit a description to be given. It may be stated, however, that experience of the great variety of pans that have from time to time been devised has led to

the adoption of the more simple forms, in which the grinding is effected between horizontal flat surfaces instead of curved or conical bottoms, and in the pans now usually employed these flat grinding surfaces form an annular floor round a central cone through which a vertical shaft passes. The Knox pan, fig. 7, may be considered to be fairly typical. It is of cast-iron, 4 feet in diameter and 14 inches deep. It has a false bottom to form a hollow annular space through which steam can be introduced. The centre of the yoke *d* attached to the muller *m*, is keyed to a vertical wrought-iron shaft *S*, 2 inches in diameter, which can be brought in connexion with the driving gear *G*. The blocks *r, r* are of wood. In working the pan 100

FIG. 7. — Knox Pan.

lb of skimmings are introduced, and water added until the pulp will just adhere to a stick. After three hours grinding the pulp is heated with steam. About 5 lb of mercury are added for every charge, together with a cupful of equal parts of saltpetre and sal ammoniac. After three hours further working, water with a little caustic lime is added, and the pulp is discharged first through an upper and then through a lower hole.

One of the greatest difficulties in the treatment of gold by amalgamation, and more particularly in the treatment of pyrites, arises from the so-called sickening or flouring of the mercury; that is, the particles, losing their bright metallic surfaces, are no longer capable of coalescing with or taking up other metals. Of the numerous remedies proposed the most efficacious is perhaps sodium amalgam. It appears that amalgamation is often impeded by the tarnish found on the surface of the gold when it is associated with sulphur, arsenic, bismuth, antimony, or tellurium. Wurtz<sup>1</sup> in America (1864) and Crookes in England (1865) made independently the discovery that, by the addition of a small quantity of sodium to the mercury, the operation is much facilitated. It is also stated that sodium prevents both the "sickening" and the "flouring" of the mercury which is produced by certain associated minerals. Cosmo Newberry has investigated with much care the action of certain metals in impeding amalgamation.<sup>2</sup> Wurtz recommends two amalgams, one containing 2 and the other 4 per cent. of sodium, and in practice 1 per cent. or less of these is added to the mercury in the amalgamator. Crookes employs three kinds, which he calls A, B, and C amalgams; each contains 3 per cent. of mercury, but the B variety has, in addition to the sodium, 20 per cent. of zinc, and C is mixed with 10 per cent. of zinc and 10 per cent. of tin. The addition of cyanide of potassium has been suggested to assist the amalgamation and to prevent "flouring," but Skey<sup>3</sup> has shown that its use is attended with loss of gold.

**Separation of Gold from the Amalgam.**—The amalgam is first pressed in wetted canvas or buckskin in order to remove excess of mercury. According to Rittinger, mercury will dissolve from 0.05 to 0.08 per cent. of native gold of standard 650 to 850 without loss of fluidity, the solubility of the gold increasing with its fineness; and until the point of saturation is reached, no separation of solid amalgam is possible. Lumps of the solid amalgam, about 2 inches in

diameter, are introduced into an iron vessel lined with a paste of fire-clay and wood ashes, and provided with an iron tube that dips below the surface of water. The distillation is then effected by heating, care being taken that the retort does not become visibly red in daylight. The amalgam yields about 30 to 40 per cent. of gold. In California the amalgam is retorted in cast-iron pans placed in cast-iron cylinders 11 inches in diameter, 4 feet 6 inches long, supported on brick work. The bullion left in the retorts is then melted in black-lead crucibles, with the addition of small quantities of suitable fluxes.

The extraction of gold from auriferous minerals by fusion, except as an incident in their treatment for other metals, is very rarely practised. It was at one time proposed to treat the concentrated black iron obtained in the Ural gold washings, which consists chiefly of magnetite, as an iron ore, by smelting it with charcoal for auriferous pig-iron, the latter metal possessing the property of dissolving gold in considerable quantity. By subsequent treatment with sulphuric acid the gold could be recovered. Experiments on this point were made by Anossow in 1835, but they have never been followed in practice.

Gold in galena or other lead ores is invariably recovered in the refining or treatment of the lead and silver obtained. Pyritic ores containing copper are treated by methods analogous to those of the copper smelter. This is extensively done. In Colorado the pyritic ores containing gold and silver in association with copper are smelted in reverberatory furnaces for regulus, which, when desilverized by Ziervogel's method, leaves a residue containing 20 or 30 ounces of gold per ton. This is smelted with rich gold ores, notably those containing tellurium for white metal or regulus; and by a following process of partial reduction analogous to that of selecting in copper smelting, "bottoms" of impure copper are obtained in which practically all the gold is concentrated. By continuing the treatment of these in the ordinary way of refining, poling, and granulating, all the foreign matters other than gold, copper, and silver are removed, and, by exposing the granulated metal to a high oxidizing heat for a considerable time, the copper may be completely oxidized while the precious metals are unaltered. Subsequent treatment with sulphuric acid renders the copper soluble in water as sulphate, and the final residue contains only gold and silver, which is parted or refined in the ordinary way. This method of separating gold from copper, by converting the latter into oxide and sulphate, is also used at Oker in the Harz.

**Chlorination Process.**—Plattner suggested that the residues from certain mines at Reichenstein, in Silesia, should be treated with chlorine after the arsenical products had been extracted by roasting. The process, which depends upon the fact that chlorine acts rapidly upon gold, but does not attack ferric oxide, is now adopted in Grass Valley, California, where the waste minerals, principally pyrites from tailings, have been worked for a considerable time by amalgamation. The roasting is conducted at a low temperature in some form of reverberatory furnace. Salt is added in the roasting to convert all the metals present, except iron, into chlorides. The auric chloride is, however, decomposed at the elevated temperature into finely-divided metallic gold, which is then readily attacked by the chlorine gas. The roasted mineral, slightly moistened, is next introduced into a wooden vat, pitched inside, and furnished with a double bottom, as is shown in fig. 8. Chlorine

Fig. 8.

<sup>1</sup> *American Journal of Science and Arts*, vol. xli., March 1866.

<sup>3</sup> *Transactions of the New Zealand Institute*, 1876.

is led from a suitable generator beneath the false bottom, and rises through the moistened ore, resting on a bed of broken quartz below the false bottom, converting the gold into a soluble chloride, which is afterwards removed by washing with water. The precious metal is then precipitated as metallic gold by sulphate of iron. The process has been greatly improved in America by Küstel, Deetken, and Hoffmann; with proper care it is a very perfect one, and yields 97 per cent. of the gold originally present in the ore. It is stated not to cost more in California than 50s. a ton. Any silver originally present in the ore is of course converted into chloride of silver and remains with the residue, from which it may be extracted by the solvent action of brine or by amalgamation.

*Refining or Parting Gold from other Metals.*—Strabo states<sup>1</sup> that in his time a process was employed for refining and purifying gold in large quantities by cementing or burning it with an aluminous earth, which, by destroying the silver, left the gold in a state of purity. Pliny shows that for this purpose the gold was placed on the fire in an earthen vessel with treble its weight of salt, and that it was afterwards again exposed to the fire with two parts of salt and one of argillaceous rock, which, in the presence of moisture, effected the decomposition of the salt; by this means the silver became converted into chloride. In a similar process still practised in New Granada the granulated argentiferous gold is mixed with one part of common salt and two parts of brick dust. In the presence of moisture, effected by the passage of aqueous vapour through the porous pots in which the mixture is heated, the salt acts on the brick dust, producing silicate of soda, and the evolution of hydrochloric acid affords a source of chlorine for the silver. The chloride of silver formed fuses readily and drops off, exposing a fresh surface of the alloy to the action of the gas.

Various methods for separating gold from silver or other alloys appear to have been in use from ancient times. Among these may be mentioned prolonged oxidation by exposure to air, and treatment with sulphur, sulphide of antimony, and corrosive sublimate. In the Harz, 2 ounces of the granulated alloy of gold and silver were mixed and heated with 1 ounce of sulphur, litharge being added to separate the gold remaining in the sulphide of silver.

*Parting by Nitric Acid*, the old process of refining, is now practised in England by only one firm, although in some refineries both the nitric acid and the sulphuric acid processes are combined, the alloy being first treated with nitric acid. It used to be called "quartation," from the fact that 4 parts of the alloy best suited for the operation of refining contain 3 parts of silver and 1 of gold. The operation may be conducted in vessels of glass or platinum, and each pound of granulated metal is treated with a pound and a quarter of nitric acid of specific gravity 1.32. It is the method employed in the assay of gold (see ASSAYING).

*Refining by Sulphuric Acid* is the process usually adopted for separating gold from silver on the large scale. It appears to have been proposed in France by Dizé at the beginning of the present century. It was actually in use in France in 1820, and was introduced into the Mint refinery, London, by Mr Mathison in 1829.<sup>2</sup> It is based upon the facts that concentrated hot sulphuric acid converts silver and copper into soluble sulphates without attacking the gold, the sulphate of silver being subsequently reduced to the metallic state by copper plates with the formation of sulphate of copper.

About 80 lb of the granulated alloy are boiled for three

or four hours in a platinum vessel (fig. 9) with 2.5 times its weight of sulphuric acid of specific gravity 1.84. The sulphurous acids which arise are partially condensed before being allowed to pass into the air. When the acid has

FIG. 9.—Refinery Siphon and Alembic.

ceased to act on the metal, a small quantity of sulphuric acid of specific gravity 1.53 is added, and, after a second boiling, the contents of the vessel are allowed to settle. The supernatant liquid is then withdrawn from the gold, which falls to the bottom of the vessel, and is diluted until its density is 1.21 or 1.26. The silver is usually precipitated from solution by copper plates, but sometimes iron is used, and the silver is roughly dried and compressed by an hydraulic press before it is melted into ingots. The gold, which is often again treated with sulphuric acid, is then washed and melted into ingots that contain from 997 to 998 parts of gold in 1000. The operation of parting may be conducted in iron or platinum vessels; the use of the former was advocated by M. Tocchi, and they are still extensively employed. Magnificent vessels of platinum have, however, been made in England by Messrs Johnson, Matthey, & Co. The alloys best suited for the operation contain from 800 to 950 of silver and 50 to 200 of copper and gold, but the proportion of gold must not exceed 200 parts in 1000. Refiners obtain alloys in suitable proportions by mixing together auriferous silver and argentiferous gold, the proportions of the respective metals having been previously indicated by assay. By such an arrangement, silver which contains but the 0.0004 part of gold, or 2.25 grains in the troy pound, may be profitably treated.

*Cost of Refining.*—The charge to the public for refining depends in a great measure on the amount of metal to be operated upon and its richness. In England, however, it may be considered to be about 1d. per ounce for the silver and 4d. per ounce for gold. In France the charge is about 90 cents to 1 franc 25 cents for a kilogramme of silver.

The Lower Harz smelting works produce annually from 50 to 55 cwt. of test silver of an average fineness of 950 silver and 50 gold per 1000; the proportion of the latter metal is, however, variable, being lowest (3 per 1000) in the silver obtained from clean lead ores, and highest (10 per 1000) in that separated from argentiferous copper ores,—that from the mixed copper and lead ores being of intermediate richness. The silver, in quantities of 25 kilogrammes, is refined upon small tests in a muffle, and when sufficiently purified is granulated by ladling it into water, whereby thin flattened granules suitable for dissolving are obtained.

The parting vessels (fig. 10) are of porcelain which, to protect them against fracture by irregular heating, are covered with wire netting and plastered over with a mixture of clay and smithy scales. They are mounted in a frame and set loose in an iron pot with a hemispherical bottom, which is heated by a fire from below; the pot also serves to catch the contents of the porcelain vessel if the latter should be accidentally broken. The cover is perforated by a hole in the centre for the passage of a lead pipe to carry off the sulphurous acid fumes,

<sup>1</sup> Fabbroni, *Ann. Chim.*, t. lxxii. p. 25.

<sup>2</sup> Report on the Royal Mint, 1837, Appendix, p. 59.

and a smaller one at one side through which acid may be introduced. These, as well as other connexions on the pipes carrying off the vapours, are secured by water-joints. The charge of about 200 ounces (6.25 kilogrammes) of granulated silver is treated with twice its weight of sulphuric acid marking 66° Baumé, and, by careful firing, is dissolved in six hours. The proper management of the heat is of importance, as neglect in the conduct of the operation may easily lead to a breakage of the pot. When the charge is completely dissolved the liquid is allowed to settle for some time, and is then poured off into a lead pan, where the silver sulphate solidifies. This, when redissolved by an addition of water and careful warming, is treated with strips of copper, the separation of the silver being facilitated by agitating the liquid. When the latter is found to be completely free from silver the heating is stopped, and the contents of the pan are allowed to settle for eighteen hours, when the copper solution is drawn off by a siphon and sent to the vitriol crystallizers. In the precipitation of 100 kilogrammes of silver about 30 kilogrammes of sheet-copper are expended.

Fig. 10.

The precipitated silver is washed with water in a copper vessel upon a linen filter until the reaction of copper in the washings ceases, and then moulded in cylindrical blocks by screw pressure, to express the residual water. These when fire-dried are melted in black-lead pots, holding 75 lb, with the addition of a little soda nitre.

The parted gold remaining in the porcelain pot, though already sensibly finer than is usual when iron parting vessels are used, still contains silver, and is therefore boiled once more with sulphuric acid of 66° Baumé. Afterwards it is washed with water until silver can be no longer detected in the washings, when it is transferred to a porcelain dish and dried. When a quantity of about 10 lb of gold has been accumulated, it is mixed with a little borax glass, melted in a black-lead pot, and cast. The resulting bars average  $\frac{985}{1000}$  fine.

**Refining by Chlorine Gas.**—F. Bowyer Miller<sup>1</sup> devised in 1867 the following method for separating silver from gold. The process, which is the one now adopted in the Australian mints,<sup>2</sup> consists in converting the silver into chloride by the passage of a stream of chlorine gas through the molten alloy. Clay crucibles are employed after having been saturated with a strong solution of borax and allowed to dry. The chlorine is introduced through the gold by a clay pipe passing to the bottom of the crucible, and connected with the chlorine generator in which the necessary pressure is obtained by a pressure tube 8 feet

high. The chloride of silver is easily poured off from the surface of the molten metal, and by carefully fusing with a little carbonate of soda, the small amount of gold it retains is separated and falls to the bottom of the crucible. The gold operated upon contains from 3 to 12 per cent. of silver, and the average fineness of the refined gold is 994. The operation is now conducted on a considerable scale in Australia, and in the years 1871 and 1872 no less than 1,100,000 ounces of gold were refined by its aid in Sydney alone. The absolute loss of gold does not exceed 14 parts in 100,000.

**Toughening Brittle Gold.**—It will be seen from p. 751 that minute traces of certain metals, which do not exceed the  $\frac{1}{10000}$ th part of the mass, render gold brittle and unfit for coinage. Miller showed that the removal of the deleterious metals might be effected by converting them into volatile chlorides by a stream of chlorine gas. The process was introduced into the English mint by Roberts,<sup>3</sup> who successfully treated over 40,000 ounces of brittle gold with but trifling loss of precious metal. Wagner has suggested<sup>4</sup> that bromine may replace chlorine in Miller's process. Brittle gold may also be toughened by throwing a small quantity of corrosive sublimate on to the surface of the molten metal, but this method is wasteful, and the fumes evolved are deleterious. The late Mr Warrington<sup>5</sup> proposed to toughen brittle gold by the addition of about 10 per cent. of black oxide of copper. The process is efficacious, but the crucibles become much corroded and even perforated; the standard fineness of the gold is, moreover, lowered by such copper as is reduced to the metallic state. If gold is but slightly brittle, it may be toughened by pouring it in a thin stream through atmospheric air into a crucible lined with borax, or by the addition of a small quantity of chloride of copper.

**Preparation of Pure Gold.**—Chemically pure gold may be prepared by several methods. The metal, either in the form of powder or "cornets" from the purest gold that can be obtained, is dissolved in nitro-hydrochloric acid. The excess of acid is driven off, alcohol and chloride of potassium added to precipitate platinum, and the chloride of gold is then dissolved in pure distilled water, the solution being diluted until each gallon does not contain more than half an ounce of the precious metal. The solution is allowed to stand for several weeks, and the supernatant liquid is carefully removed by a siphon from any chloride of silver that may have fallen to the bottom of the vessel. The gold may then be precipitated by a stream of carefully washed sulphurous anhydride, or by the addition of oxalic acid, formic acid, or ferrous sulphate. The spongy gold is washed with dilute hydrochloric acid, distilled water, ammonia water, and again with distilled water, after which it is melted in a clay crucible with a little bisulphate of potash and borax, and poured into a stone mould. Roberts<sup>6</sup> prepared by this method 70 ounces of gold of which the average purity was 999.96, the precipitant being oxalic acid. Gold precipitated by oxalic acid from an acid solution containing copper is always contaminated with cupric oxalate. E. Purgotti<sup>7</sup> has, however, shown that by heating the solution with the addition of potash, a soluble double oxalate of copper and potash is formed, and the gold is left in the pure state.

**Alloys of Gold.**—The most important alloys are those with silver and copper. Those used for coinage at the present day contain from 800 parts of gold in 1000, the standard of the Norwegian 2-kroner

<sup>7</sup> Zeitschr. Anal. Chem., ix. 127.

piece, to 986.6, that of the Austrian reichsducaten, the alloying metal being mainly copper. In England, when gold coins were first introduced by Henry III., in 1257, they were of pure gold. Edward III., in 1345, was the first to use a standard 994.8, and in 1526 Henry VIII. issued crowns of the double rose of the standard 916.6 for concurrent issue with sovereigns, and other coins of the original standard 994.8. In 1544 the standard for all gold coins

was reduced to 916.6, and again in 1546 to 833.4, the lowest point ever reached in England. Mary restored the old standard 994.8. Elizabeth directed that coins of both standards, 916.6 and 994.8, should be issued, and the latter was employed at intervals until 1640. Since then the lower standard, 916.6, has been solely used, and, as is shown by the following extract from the Coinage Act of 1870, 33 Vic. c. 10, is the one now in use:—

| Denomination of Coin. | Standard Weight.           |                          | Least Current Weight.     |                          | Standard Fineness.                                                          | Remedy Allowance. |               |                      |

In America and in those countries which have formed the "Latin Convention," the standard of gold coin is 900, with a "remedy" of  $\pm 1\frac{1}{2}\%$ . M. Peligot suggested<sup>1</sup> that by employing a triple alloy containing 58.1 per cent. of gold, 36.1 of copper, and 5.8 of zinc, a coin might be produced which, while being of the value of 25 francs, would have the decimal weight of 10 grammes. The alloy is perfectly malleable and of good colour. In England the following standards are used for plate and jewellery, 375, 500, 625, 750, and 916.6, the alloying metal being silver and copper in varying proportions. In France three alloys of the following standards are used for jewellery, 920, 840, and 750. A greenish alloy used by goldsmiths contains 70 per cent. of silver and 30 per cent. of gold. "Blue gold" is stated to contain 75 per cent. of gold and 25 per cent. of iron. The Japanese use for ornament an alloy of gold and silver, the standard of which varies from 350 to 500, the colour of the precious metal being developed by "pickling" in a mixture of plum-juice, vinegar, and sulphate of copper. They may be said to possess a series of bronzes, in which gold and silver replace tin and zinc, all these alloys being characterized by patina having a wonderful range of tint. The common alloy, Shi-ya-ku-Do, contains 70 per cent. of copper and 30 per cent. of gold; when exposed to air it becomes coated with a fine black patina, and is much used in Japan for sword ornaments. Gold wire may be drawn of any quality, but it is usual to add 5 to 9 dwts. of copper to the pound.<sup>2</sup>

The "solders" used for red gold contain 1 part of copper and 5 of gold; for light gold, 1 part of copper, 1 of silver, and 4 of gold.

**Alloys of Gold and Silver.**—Electrum, the natural alloy of gold and silver, has already been described, p. 740. Matthiessen observed that the density of those alloys, the composition of which varies from  $\text{AuAg}_5$  to  $\text{Au}_2\text{Ag}$ , is greater than that calculated from the densities of the constituent metals. These alloys are harder, more fusible, and more sonorous than pure gold. The alloys of the formulae  $\text{AuAg}$ ,  $\text{AuAg}_2$ ,  $\text{AuAg}_3$ , and  $\text{AuAg}_4$  are perfectly homogeneous, and have been studied by Levol.<sup>3</sup> Hatchett has shown,<sup>4</sup> by a series of careful experiments, that certain metals, even when present in such small quantities as the  $\frac{1}{1000}$ th part of the mass, render standard gold brittle and unfit for rolling. These metals are bismuth, lead, antimony, arsenic, and zinc.

**Gold and Zinc.**—With regard to the latter metal, it may be remarked that, although its presence in small quantities renders gold brittle, it may be added to gold in larger quantities without destroying the ductility of the precious metal, for, as has been already stated, Peligot proved that a triple alloy of gold, copper, and zinc, which contains 5.8 per cent. of the last-named, is perfectly ductile. The alloy of 11 parts gold and 1 part of zinc is, however, stated to be brittle.

**Gold and Tin.**—Alchorne<sup>5</sup> showed that gold alloyed with  $\frac{1}{3}$ th part of tin is sufficiently ductile to be rolled and stamped into coin, provided the metal is not annealed at a high temperature. The alloys of tin and gold are hard and brittle, and the combination of the metals is attended with contraction; thus the alloy  $\text{SnAu}$  has a density 14.243, instead of 14.828 indicated by calculation. Matthiessen and Bose<sup>6</sup> obtained large crystals of the alloy  $\text{Au}_2\text{Sn}_3$ , having the colour of tin, which changed to a bronze tint by oxidation.

**Gold and Iron.**—Hatchett found that the alloy of 11 parts gold and 1 part of iron is easily rolled without annealing. In these proportions the density of the alloy is less than the mean of its constituent metals.

**Gold and Palladium.**—These metals are stated to alloy in all proportions. According to Chenevix,<sup>7</sup> the alloy composed of equal parts of the two metals is grey, is less ductile than its constituent metals, and has the specific gravity 11.08. The alloy of 4 parts of gold and 1 part of palladium is white, hard, and ductile. Graham has shown<sup>8</sup> that a wire of palladium alloyed with from 24 to 25 parts of gold does not exhibit the remarkable retraction which, in pure palladium, attends its loss of occluded hydrogen.

**Gold and Platinum.**—Clarke states that the alloy of equal parts of the two metals is ductile, and has almost the colour of gold.

**Gold and Rhodium.**—Gold alloyed with  $\frac{1}{4}$ th or  $\frac{1}{5}$ th of rhodium is, according to Wollaston, very ductile, infusible, and of the colour of gold.

**Gold and Iridium.**—Small quantities of iridium do not destroy the ductility of gold, but this is probably because the metal is only disseminated through the mass, and not alloyed, as it falls to the bottom of the crucible in which the gold is fused.

**Gold and Nickel.**—Eleven parts of gold and 1 of nickel yield an alloy resembling brass.

**Gold and Cobalt.**—Eleven parts of gold and 1 of cobalt form a brittle alloy of a dull yellow colour.

**Assay of Gold.**—It may be well to supplement the information given in the article ASSAYING with some additional details as to the assay of gold bullion, as practised in the Royal Mint, and of gold ores. The assay of bullion consists of six operations:—

(1.) The sample of metal taken for assay is flattened, and an assistant adjusts a portion of it to an exact weight by cutting or filing. This weight varies with different operators from 5 to 16 grains. The assayer then completes the adjustment on a more sensitive balance. The prepared assay piece is wrapped in lead foil, together with a certain amount of pure silver, which is generally equal to  $2\frac{1}{2}$  times the amount of gold assumed to be present. In the case of standard gold, the weight of lead employed is to the weight of the alloy taken for assay as 8 to 1, and the ratio of the weight of lead to the weight of copper present is 100:1. Much diversity of opinion exists as to the amount of lead that should be employed. The proportions recommended by D'Arcet<sup>9</sup> are considerably less than those advocated by Kandelhardt;<sup>10</sup> and it may be stated, with regard to the silver, that the last mentioned authority and Chaudet recommend the proportion of 1 of gold to  $2\frac{1}{2}$  of silver, but Pettenkofer states that the proportion need not exceed 1 to  $1\frac{1}{2}$ , provided that the subsequent boiling in nitric acid is sufficiently prolonged. The amount of gold lost in cupellation has been shown by Rossler to increase with the amount of lead used, and to decrease as the amount of silver is increased.<sup>11</sup>

(2.) The necessary number of cupels are arranged on the bottom of the muffle (fig. 2, ASSAYING), and the packets containing the silver and gold are transferred from a numbered wooden range to corresponding cupels. The furnace operations are then performed as is described in ASSAYING (p. 727), and the result is that each cupel contains a button of silver and gold.

(3.) The button *a* (fig. 11) is flattened by striking it with a hammer on a polished anvil, first in the centre, and then on the edge, a third blow being given on the opposite edge which elongates the metal. After annealing in an iron tray, the flattened buttons *b* are reduced by laminating rolls to the thickness of a visiting card *c*. They are again annealed and rolled into a spiral or cornet *d*.

(4.) These cornets are then treated with nitric acid of specific gravity 1.2, either separately in parting flasks, or together in cups

of platinum, which are introduced into a suitable vessel of platinum, an arrangement by which it will be evident much time may be saved. The boiling is then continued for fifteen or twenty minutes, when the cornets are washed with distilled water, and treated with nitric acid of specific gravity 1.3, and in this the cornets remain for about the same period, after which they are again washed in distilled water and dried.

Fig 11

(5) The cornets are annealed, separately, in little clay crucibles or in the platinum cups in which they have been boiled, by heating them to bright redness. They then diminish considerably in bulk as *c* (fig 11), and are of a pure yellow colour.

(6) The cornets are then weighed in comparison with "check assays" made on pure gold. These "checks" are necessary, as the accuracy of the result of an assay is liable to be affected either by retention of silver or copper, or by loss of gold by volatilization in the muffle, solution in the acid, or retention in the cupel. The weight of gold, therefore, indicated by the balance, may be either less or greater than the amount originally present in the alloy. The correction to be applied to a gold assay will be evident from the following formula—

Let 1000 be the weight of alloy originally taken,  
 $p$  the weight of the piece of gold finally obtained,  
 $x$  the actual amount of gold in the alloy expressed in thousandths,  
 $a$  the weight of gold (supposed to be absolutely pure) taken as a check, which approximately equals  $x$ ,  
 $b$  the loss or gain in weight experienced by  $a$  during the process of assay, expressed in thousandths,  
 $k$  the variation of "check gold" from absolute purity, expressed in thousandths,

then the actual amount of fine gold in the check-piece  
 $= a \left( 1 - \frac{k}{1000} \right)$ , and  $x$  the corrected weight of the assay will  
 $= p - \frac{a k}{1000} \pm b$ ,  $b$  being added or subtracted according as it is a loss or gain.

If  $a$  be assumed to be equal to  $x$  this equation becomes  
 $x = \frac{p \pm b}{1 + \frac{k}{1000}}$

*Example*—Let  $p = 901.1$  thousandths

$a = 920.0$      "  
 $b = 0.8$      "  
 $k = 0.1$      "     gain in weight

Then by the first formula—

$$x = 901.1 - \frac{920 + 0.1}{1000} - 0.8;$$

For, as  $b$  is a gain in weight, it must be deducted, hence

$$x = 901.1 - 0.092 - 0.8$$

$$= 900.708$$

And by the second formula—

$$x = \frac{901.1 - 0.8}{1 + \frac{0.1}{1000}}$$

$$= 900.708$$

*Assay of Gold Ores*—500 grains of the finely powdered sample, which must be taken with the greatest care and accuracy, is passed through a sieve of fine wire gauze with at least 80 meshes to the linear inch. Any residue there may be of flattened particles of gold is set aside for subsequent treatment, usually by direct cupellation. Assay of the ore by fusion with litharge is best suited to ores which do not contain much iron pyrites. For auriferous quartz

500 grains of the ore are fused with 500 grains of red lead, 300 grains of solid carbonate, 20 grains of powdered charcoal and 250 grains of borax. The mixture is introduced into a clay crucible, which it should half fill, and is fused in an furnace. The button of reduced lead may be removed either by pouring the contents of the crucible into a mould, or by breaking the crucible when cold. If the ore contains much iron pyrites, or is of the nature of "sweep" the name given to carbonaceous residues which accumulate in mint and goldsmiths shops it will be necessary to roast it in a shallow fire clay dish placed in a muffle. In the case of pyrites containing about 7 lbs. to the ton, the operation would be conducted on about 1000 grains. The roasted ore is then fused with about the same mixture of fluxes as has been given for quartz.

*Assay by Scoriafication*—Scoriafication resembles cupellation, but the oxide of lead produced in the operation, instead of sinking into a porous cup, is held in a flat saucer of fire clay, and dissolves the earthy constituents of the ore, leaving the precious metal to pass into another portion of lead which remains in the metallic state. About 200 grains of the roasted ore are placed in the scorifier, intimately mixed with 500 grains of granulated and 50 grains of borax lead, 500 grains of lead are then distributed over the surface of the mixture, the contents of the scorifier are fused in a muffle, air is admitted to oxidize the greater portion of the lead, and, at the conclusion of the operation, the litharge should be perfectly fluid and cover the molten lead. The slag may be freed from particles of precious metal by the addition at the conclusion of the operation of a small quantity of powdered anthracite which reduces a portion of the litharge to metallic globules, which fall through the slag and unite with the lead button. The gold is then separated by cupellation, and the silver with which it is nearly always associated is removed by putting in nitric acid.

*Assay by means of the Spectroscope*—Loefer and Roberts<sup>2</sup> state, as the result of a careful spectroscopic investigation of the alloys of gold and copper, that it is possible to distinguish between alloys of these metals which only differ in proportion by 1/100th part. Their experiments have been repeated in America by A. L. Outerbridge.<sup>3</sup>

(W. C. R.—H. B.)

It will be convenient to give here, in connexion with the article GOLD, rather than in their proper alphabetical place, the articles GOLDBEATING and GOLD LEAF.

**GOLDBEATING** The art of goldbeating is of great antiquity, being referred to by Homer, and Pliny states that one ounce of gold was extended to 750 leaves, each leaf being four fingers square, which is three times the thickness of the ordinary leaf gold of the present time. In all probability the art originated among Oriental communities, where the working of gold and the use of gold ornaments have been distinguishing characteristics from the most remote periods, and in India goldbeating is still carried on as a craft involving many mysteries and great difficulties. On the coffins of the Theban mummies specimens of original leaf gilding are met with, where the gold is in so thin a state that it resembles modern gilding. The Incas of Peru do not appear to have been able to reduce gold further than to plates which could be nailed for ornamentation on the walls of their temples. In England goldbeating was confined to London until within the present century. It was introduced into Scotland and the United States within that period, and it is now practised in most towns of any considerable size, but so far as concerns Great Britain it is principally centred in London. One grain of gold has been beaten out to the extent of 75 square inches, and the same weight of silver to 98 square inches. Taking a cubic inch of gold at 4900 grains, this gold leaf is the 367,650th part of an inch in thickness, or about 1200 times thinner than ordinary printing paper. The silver, though spread over a larger surface, was thicker, owing to the difference in its specific gravity, but, calculated by weight, silver is the most malleable metal with which we are acquainted, in that respect considerably exceeding gold. This experiment does not, however, determine the extent of the malleability of either metal, as the means employed to test it were found to fail before there was any appearance of the malleability of the metals.

<sup>2</sup> *Phil Trans*, 1874, vol. clxiv p. 495

<sup>3</sup> *Journal of the Franklin Institute*, 1874

<sup>1</sup> *Fourth Annual Report of the Deputy Master of the Mint*, 1873, p. 42

being exhausted. In practice the average degree of tenuity to which the gold is reduced is not nearly so great as the example above quoted. A "book of gold" containing 25 leaves measuring each  $3\frac{1}{4}$  inches, equal to an area of 264 square inches, generally weighs from 4 to 5 grains.

The gold used by the goldbeater is variously alloyed, according to the variety of colour required. Fine gold is commonly supposed to be incapable of being reduced to thin leaves. This, however, is not the case, although its use for ordinary purposes is undesirable on account of its greater cost. It also adheres on one part of a leaf touching another, thus causing a waste of labour by the leaves being spoiled; but for work exposed to the weather it is much preferable, as it is more durable, and does not tarnish or change colour. The external gilding on many public buildings, such, *e.g.*, as the Albert Memorial in Hyde Park, London, is done with pure gold. The following is a list of the principal classes of leaf recognized and ordinarily prepared by British beaters, with the proportions of alloy per ounce they contain.

| Name of Leaf       | Proportion of Gold | Proportion of Silver | Proportion of Copper. |
|--------------------|--------------------|----------------------|-----------------------|
|                    | Grains.            | Grains               | Grains                |
| Red.....           | 456-460            | ...                  | 20-24                 |
| Pale red.....      | 464                | ...                  | 16                    |
| Extra deep.....    | 456                | 12                   | 12                    |
| Deep.....          | 444                | 24                   | 12                    |
| Citron.....        | 440                | 30                   | 10                    |
| Yellow.....        | 408                | 72                   | ...                   |
| Pale yellow.....   | 384                | 96                   | ...                   |
| Leimon.....        | 360                | 120                  | ...                   |
| Green or pale..... | 312                | 168                  | ...                   |
| White.....         | 240                | 240                  | ...                   |

The process of goldbeating is thus conducted. The gold, having been alloyed according to the colour desired, is melted in a crucible, at a higher temperature than is simply necessary to fuse it, as its malleability is improved by exposure to a greater heat; sudden cooling does not interfere with its malleable properties, gold differing in this respect from some other metals. It is then cast into an ingot, and flattened, by rolling between a pair of powerful smooth steel rollers, into a ribbon of  $1\frac{1}{2}$  inch wide and 10 feet in length to the ounce. After being flattened it is annealed and cut into pieces of about  $6\frac{1}{2}$  grs. each, or about 75 per ounce, and placed between the leaves of a "cutch," which is about half an inch thick and  $3\frac{1}{2}$  inches square, containing about 180 leaves of a tough paper manufactured in France. Formerly fine vellum was used for this purpose, and generally still it is interleaved in the proportion of about one of vellum to six of paper. The cutch is beaten on for about 20 minutes with a 17-pound hammer, which rebounds by the elasticity of the skin, and saves the labour of lifting, by which the gold is spread to the size of the cutch; each leaf is then taken out, and cut into four pieces, and put between the skins of a "shoder,"  $4\frac{1}{2}$  inches square and  $\frac{3}{4}$ ths of an inch thick, containing about 720 skins, which have been worn out in the finishing or "mould" process. The shoder requires about two hours' beating upon with a 9-pound hammer. As the gold will spread unequally, the shoder is beaten upon after the larger leaves have reached the edges. The effect of this is that the margins of larger leaves come out of the edges in a state of dust. This allows time for the smaller leaves to reach the full size of the shoder, thus producing a general evenness of size in the leaves. Each leaf is again cut into four pieces, and placed between the leaves of a "mould," composed of about 950 of the finest gold-beaters' skins, five inches square and three-quarters of an inch thick, the contents of one shoder filling three moulds. The material has now reached the last and most difficult stage of the process; and on the fineness of the skin and judgment of the workman the perfection and thinness of the leaf of gold depend. During the first hour the hammer is allowed to fall principally upon the centre of the mould. This causes gaping cracks upon the edges of the leaves, the sides of which readily coalesce and unite without leaving any trace of the union after being beaten upon. At the second hour, when the gold is about the 150,000th part of an inch in thickness, it for the first time permits the transmission of the rays of light. In pure gold, or gold but slightly alloyed, the green rays are transmitted; and in gold highly alloyed with silver, the pale violet rays pass. The mould requires in all about four hours' beating with a 7-pound hammer, when the ordinary thinness for the gold leaf of commerce will be reached. A single ounce of gold will at this stage be extended to  $75 \times 4 \times 4 = 1200$  leaves, which will trim to squares of about  $3\frac{1}{4}$  inches each. The finished leaf is then taken out of the mould,

and the rough edges are trimmed off by slips of the ratan fixed in parallel grooves of an instrument called a waggon, the leaf being laid upon a leathern cushion for that purpose. The sizes to which British leaf is cut are  $3, 3\frac{1}{8}, 3\frac{1}{4}, 3\frac{3}{8},$  and  $3\frac{1}{2}$  inches. The leaves thus prepared are placed into "books" capable of holding 25 leaves each, which have been rubbed over with red ochre to prevent the gold clinging to the paper. The leaf is used for gilding picture-frames, and for other ornamental purposes. See GILDING.

The fine membrane called goldbeaters' skin, used for making up the shoder and mould, is the outer coat of the cæcum or blind gut of the ox. It is stripped off in lengths about 25 or 30 inches, and freed from fat by dipping in a potash solution and scraping with a blunt knife. It is afterwards stretched on a frame; two membranes are glued together, treated with a solution of aromatic substances or camphor in isinglass, and subsequently coated with white of egg. Finally they are cut into squares of 5 or  $5\frac{1}{2}$  inches; and to make up a mould of 950 pieces the gut of about 380 oxen is required, about  $2\frac{1}{2}$  skins being got from each animal. A skin will endure about 200 beatings in the mould, after which it is fit for use in the shoder alone.

The dryness of the cutch, shoder, and mould is a matter of extreme delicacy. They require to be hot-pressed every time they are used, although they may be used daily, to remove the moisture which they acquire from the atmosphere, except in extremely frosty weather, when they acquire so little moisture that then a difficulty arises from their over-dryness, whereby the brilliancy of the gold is diminished, and it spreads very slowly under the hammer. On the contrary, if the cutch or shoder be damp, the gold will become that which is technically termed hollow or sieve-like; that is, it is pierced with innumerable microscopical holes; and in the moulds in its more attenuated state it will become reduced to a pulverulent state. This condition is more readily produced in alloyed golds than in fine gold. It is necessary that each skin of the mould should be rubbed over with calcined gypsum (the fibrinated variety) each time the mould may be used, in order to prevent the adhesion of the gold to the surface of the skin in beating. Dentist gold is gold leaf carried no further than the cutch stage, and should be perfectly pure gold.

By the above process also silver is beaten, but not so thin, the inferior value of the metal not rendering it commercially desirable to bestow so much labour upon it. Copper, tin, zinc, palladium, lead, cadmium, platinum, and aluminium can be beaten into thin leaves, but not to the same extent as gold or silver.

**GOLD AND SILVER LACE.** Under this heading a general account may be given of the use of the precious metals in textiles of all descriptions into which they enter. That these metals were used largely in the sumptuous textiles of the earliest periods of civilization there is abundant testimony; and to this day, in the Oriental centres whence a knowledge and the use of fabrics inwoven, ornamented, and embroidered with gold and silver first spread, the passion for such brilliant and costly textiles is still most strongly and generally prevalent. The earliest mention of the use of gold in a woven fabric occurs in the description of the ephod made for Aaron (Exod. xxxix. 2, 3)—"And he made the ephod of gold, blue, and purple, and scarlet, and fine twined linen. And they did beat the gold into thin plates, and cut it into wires (strips), to work it in the blue, and in the purple, and in the scarlet, and in the fine linen, with cunning work." In both the *Iliad* and the *Odyssey* distinct allusion is frequently made to inwoven and embroidered golden textiles. Many circumstances point to the conclusion that the art of weaving and embroidering with gold and silver originated in India, where it is still principally prosecuted, and that from one great city to another the practice travelled westward,—Babylon, Tarsus, Baghdad, Damascus, the islands of Cyprus and Sicily, Con-

stantinople and Venice, all in the process of time becoming famous centres of these much prized manufactures. Alexander the Great found Indian kings and princes arrayed in robes of gold and purple; and the Persian monarch Darius, we are told, wore a war mantle of cloth of gold, on which were figured two golden hawks as if pecking at each other. There is reason, according to Josephus, to believe that the "royal apparel" worn by Herod on the day of his death (Acts xii. 21) was a tissue of silver. Agrippina, the wife of the emperor Claudius, had a robe woven entirely of gold, and from that period downwards royal personages and high ecclesiastical dignitaries used cloth and tissues of gold and silver for their state and ceremonial robes, as well as for costly hangings and decorations. In England, at different periods, various names were applied to cloths of gold, as ciclatoun, tartarium, naques or nac, baudekin or baldachin, Cyprus damask, and twssewys or tissue. The thin flimsy paper known as tissue paper, is so called because it originally was placed between the folds of gold "tissue" to prevent the contiguous surfaces from fraying each other. At what time the drawing of gold wire for the preparation of these textiles was first practised is not accurately known. The art was probably introduced and applied in different localities at widely different dates, but down till mediæval times the method graphically described in the Pentateuch continued to be practised with both gold and silver.

Fabrics woven with gold and silver continue to be used on the largest scale to this day in India; and there the preparation of the varieties of wire, and the working of the various forms of lace, brocade, and embroidery, is at once an important and peculiar art. The basis of all modern fabrics of this kind is wire, the "gold wire" of the manufacturer being in all cases silver gilt wire, and silver wire being, of course, composed of pure silver. In India the wire is drawn by means of simple draw-plates, with rude and simple appliances, from rounded bars of silver, or gold-plated silver, as the case may be. The wire is flattened into the strip or ribbon-like form it generally assumes by passing it, fourteen or fifteen strands simultaneously, over a fine, smooth, round-topped anvil, and beating it as it passes with a heavy hammer having a slightly convex surface. From wire so flattened there is made in India *soniri*, a tissue or cloth of gold, the web or warp being composed entirely of golden strips, and *ruperi*, a similar tissue of silver. Gold lace is also made on a warp of thick yellow silk with a weft of flat wire, and in the case of ribbons the warp or web is composed of the metal. The flattened wires are twisted around orange (in the case of silver, white) coloured silk thread, so as completely to cover the thread and present the appearance of a continuous wire; and in this form it is chiefly employed for weaving into the rich brocades known as kincobs or kinkhâbs. Wires flattened, or partially flattened, are also twisted into exceedingly fine spirals, and in this form they are the basis of numerous ornamental applications. Such spirals drawn

out till they present a waved appearance, and in that state flattened, are much used for rich heavy embroideries termed karchobs. Spangles for embroideries, &c., are made from spirals of comparatively stout wire, by cutting them down ring by ring, laying each C-like ring on an anvil, and by a smart blow with a hammer flattening it out into a thin round disk with a slit extending from the centre to one edge. Fine spirals are also used for general embroidery purposes. The demand for various kinds of loom-woven and embroidered gold and silver work in India is immense; and the variety of textiles so ornamented is also very great. "Gold and silver," says Dr Birdwood in his *Handbook to the British-Indian Section, Paris Exhibition, 1878*, "are worked into the decoration of all the more costly loom-made garments and Indian piece goods, either on the borders only, or in stripes throughout, or in diapered figures. The gold-bordered loom embroideries are made chiefly at Sattara, and the gold or silver striped at Tanjore; the gold figured *mashrus* at Tanjore, Trichinopoly, and Hyderabad in the Deccan; and the highly ornamented gold-figured silks and gold and silver tissues principally at Ahmedabad, Benares, Murshedabad, and Trichinopoly."

Among the Western communities the demand for gold and silver lace and embroideries arises chiefly in connexion with naval and military uniforms, court costumes, public and private liveries, ecclesiastical robes and draperies, theatrical dresses, and the badges and insignia of various orders. To a limited extent there is a trade in gold wire and lace to India and China. The metallic basis of the various fabrics is wire round and flattened, the wire being of three kinds—1st, gold wire, which is invariably silver gilt wire; 2d, copper gilt wire, used for common liveries and theatrical purposes; and 3d, silver wire. These wires are drawn by the ordinary processes, and the flattening, when done, is accomplished by passing the wire between a pair of revolving rollers of fine polished steel. The various qualities of wire are prepared and used in precisely the same way as in India,—round wire, flat wire, thread made of flat gold wire twisted round orange-coloured silk or cotton, known in the trade as "orris," fine spirals and spangles, all being in use in the West as in the East. The lace is woven in the same manner as ribbons, and there are very numerous varieties in richness, pattern, and quality. Cloth of gold, and brocades rich in gold and silver, are woven for ecclesiastical vestments and draperies.

The proportions of gold and silver in the gold thread for the lace trade varies, but in all cases the proportion of gold is exceedingly small. An ordinary gold lace wire is drawn from a bar containing 90 parts of silver and 7 of copper, coated with 3 parts of gold. On an average each ounce troy of a bar so plated is drawn into 1500 yards of wire; and therefore about 16 grains of gold cover a mile of wire. It is estimated that about 250,000 ounces of gold wire are made annually in Great Britain, of which about 20 per cent. is used for the headings of calico, muslin, &c., and the remainder is worked up in the gold lace trade.

GOLDAST, MELCHIOR HAIMINSFELD (1576–1635), an historical writer and collector whose works did great service to the study of the older documents of Germany, was born, January 6, 1576 (or 1578), of poor Protestant parents, near Bischofzell in Thurgau. His university career at Ingoldstadt and Altdorf was cut short by his poverty; but at length, in 1603, after he had spent some time at St Gall and Geneva, partly supported by the learned and benevolent jurist Bartholomeus Schobinger, he obtained the post of secretary to Henry, duke of Bouillon, and with him he went to Heidelberg and Frankfort-on-the-Main. But Goldast,

though able and laborious, had fallen into an unsettled way of life, and in 1604 we find him in the service of the Baron Hohensax—then the possessor of that unique manuscript of old German poems which now forms one of the treasures of the National Library at Paris, and which Goldast was the first to make partially accessible by the press. Before long he was back in Switzerland, and by 1606 he was again in Frankfort living by his pen, and finding his efforts to obtain a regular post frustrated by Lipsius and Scioppius, whom he had offended by his outspokenness. In 1611 he was appointed councillor at the

court of Saxe Weimar, in 1615 he entered the service of the count of Schaumburg at Buckeburg, and in 1625 returned to Frankfurt. As the transport of his books from Buckeburg to Frankfurt was attended with danger, owing to the warlike operations then on foot, he entrusted them to the town of Bremen, and they now form part of the municipal library. Appointed in 1627 councillor to the emperor and to the elector of Treves, Goldast soon after passed into the service of the landgrave of Hesse Darmstadt, who raised him to be chancellor of the university of Giessen. He died at Giessen in the beginning of 1635. Nothing perhaps proves the value of Goldast's labours better than the fact that, in consideration of the service he has rendered, the modern historical and philological investigator is willing to condone the almost unpardonable sin of direct literary forgery of which he has been accused and convicted.

Among his more important works are his *Paucitudo veterum* (Lille 1604) which contained the *Runig Tyro* von Schottland, the *Winsbeken* and the *Winsbekin Reru* Alamannicarum *Scriptores* Frankfurt 1606 3 vols. new ed. by Senckenberg ibid 1730 *Monarchia S. Romani imperii*, Frankfurt 1621 *Commentarii de regno Bohemiae*, Hanover 1627, new ed. by H. Schminck Frankfurt 1719. He edited the works of Pukheimer and De Thou and a volume of correspondence, *Virorum Illi ad Goldastum epistolae* was published in 1688. See Senckenberg's *Goldast's Memoria*, prefixed to *Rer. Alamannicarum* Script., 1730. Bayle's Dictionary, and Von Rumer, *Geschichte der germanischen Philologie*, Munich, 1870.

**GOLDBERG**, a town in the Prussian province of Silesia, capital of a circle in the government district of Liegnitz, is situated 14 miles S W of that town, on the Katzbach, an affluent of the Oder. The principal buildings are an old church dating from the beginning of the 13th century, the Schwabe Priesemuth institution, completed in 1876, for the board and education of orphans, and the gymnasium, which in the 17th century enjoyed great prosperity, and numbered Wallenstein among its pupils. The chief manufactures are woollen cloth, flannel, gloves, stockings, leather, and beer, and there is a considerable trade in corn and fruit. Goldberg owes its origin and name to a gold mine in the neighbourhood, which, however, has been wholly abandoned since the time of the Hussite wars. Population (1875), 6492.

The town suffered heavily from the Tatars in 1241, from the plague in 1334, from the Hussites in 1428, and from the Saxon, imperial, and Swedish forces during the Thirty Years War. On 27th May 1813 a battle took place near it between the French under MacDonald and the rear guard of the Russians under Wittgenstein, and on the 23d August of the same year a skirmish in which MacDonald suffered defeat from the Prussians under Blücher.

**GOLD COAST**, a British colony in Western Africa constituted on the 24th of July 1876 by a royal charter which defines it as consisting of two settlements—(1) the Gold Coast proper, comprising "all places, settlements, and territories which may at any time belong to us in Western Africa, between the fifth degree of west longitude and the second degree of east longitude, and (2) the settlement of Lagos, similarly comprising all possessions between the second and fifth degrees of east longitude." The charter appoints a governor, establishes a legislative and an executive council, and authorizes the appointment of judges and other legal officers, &c. Both the Gold Coast colony and Lagos had previously been administered by lieutenant governors dependent on the governor of Sierra Leone, and the two divisions are still sufficiently distinct to require separate treatment.

By Bosman, the Dutch factor at Elmina in the beginning of the 16th century, the Gold Coast is said to extend "about 60 miles, beginning with the Gold River, 3 miles west of Assini, or 12 miles above Axim, and ending with the village Ponné " or 8 miles east of Acra "1. In modern times, Cape Apollonia (2° 35' W. long.) being

accepted as the western boundary, and the mouth of the Volta river (0° 41' 2" E long.) as the eastern, the whole coast measures about 225 miles, and this is divided into two sections, the windward or western and the leeward or eastern, the boundary between the two being the Secoom river (0° 3' 2" W long.). Beginning at the west, the first places on the coast that deserve to be mentioned are Grand Bassam and Assini, both French settlements up to 1870. The mouth of the river Assini forms the outlet of a series of lagoons, the eastmost of which is fed by a considerable river—the Tanno or Tando. About 55 miles eastward from this point are the Four Hills or Hummocks of Apollonia, where the English formerly had a fort, and about 20 miles from Apollonia is the mouth of the Ankobne. Three miles further and we come to Axim, the site of an old Dutch fort built near the mouth of the Axim river, and other 20 miles and we reach Great Friedrichsburg, founded by the Brandenburg Company. Rounding Cape Three Points (2° 7' W long.), whose vicinity is marked by a line of breakers nearly 2½ miles long, the first place of importance that we find is Akodah or Aquidah, and 10 miles beyond Akodah lies the better known Dixcove or Dick's Cove. From Dixcove Pomepidi is distant 10 miles, and other 12 or 13 miles brings us to Secondee, which is only 8 or 9 miles from the mouth of the Busum (or Sacred) Prah. With the exception of the Volta this is the largest river of the Gold Coast, it is on one of its tributaries that Coomassee is situated. At the mouth of the Beyah, 19 or 20 miles eastward, stands Elmina, or in the native language Edenā, one of the most important posts of European settlement, with a native population of some 10,000 (see **ELMINA**). Eight miles east of Elmina is Cape Coast Castle, which was the capital of the British territory until 1876. Anamaboe, 10 miles distant, is a town of some 4000 or 5000 inhabitants, with a free port and a good landing place, and about 38 miles further on we come to Winnebah, which up till 1812 was the seat of an English fort. About 11 miles eastward there is another abandoned fort at Barrocoe, and at Barrocoe we are only 23 miles from Acra or Accra (in Tshi Nkran), the present capital of the Gold Coast colony. It was selected instead of Cape Coast Castle on account of its comparatively healthy position. In the words of Dr A. F. Elliot, it is the healthiest station on the west coast of Africa, being surrounded for miles by fresh undulating ground, and backed at the distance of a day's journey, or about 30 miles, by a range of hills where Europeans can recruit. A sanitary station has been fixed at Akropong, 1800 feet above the sea level, where the Basel missionaries have their headquarters. About 2 miles east of Acra is the old Danish fort of Christiansborg. There is no station of much importance except Tassi, Ponce, and Great Ningo or Ningua, in the 60 miles between Acra and the Volta. The Volta, otherwise known as the Firaw, the Shilao, or the Amu, is a large river, the course of which has been only partially explored, but which may be expected to furnish a means of opening up the interior. In December 1875, M. M. J. Bonnat, journeying partly by water and partly by land, proceeded as far as Salaha or Paraha, a commercial town of some 18,000 inhabitants. He reports that the Labelle rapids, though 25 feet high, can be ascended by steamers during the rains in September and October, because at that season the river rises 50 feet. The lower part of the course is of difficult navigation in the dry season owing to the shallows. Addah, on the right bank of the river near its mouth, Quittah, the seat of a British fort, and Jellah Coffi, a trading port, are the principal places on the coast between the Volta and Flouhow, which lies at the eastmost extremity of the Volta lagoon. According to the ordinary divisions we enter the Slave Coast when we proceed east of the Volta.

<sup>1</sup> See *Nauwkeurige Beschryving van de Guinese Goud Tand-en Slave Kust*, Amsterdam, 1709 (frequently translated).

Such are the chief points of interest along the Gold Coast, but there is a considerable range of territory extending from 20 to 60 miles inland, which belongs to the colonial protectorate; and about this a few words are necessary. The western portion of the protectorate is occupied by the woody hill country of Fanti, which stretches northwards towards Ashantee. From the mouth of the Secoom a fine range varying in height from 1200 to 1500 or 1600 feet stretches N.N.E., and divides the eastern portion into two halves. Between the mountains and the sea there are large stretches of prairie land, in which the grass grows to a height of 10 or 12 feet.

The inhabitants of the Gold Coast may be divided into two great classes—the Tshi or Chee, a black type, and the Acre, a red type. The Fantis and Ashantis, both belonging to the former class, have already been described in ASHANTEE. The Akems live in a thick forest region, and maintain existence by hunting, gold-digging, and the gathering of wood snails. The capital of their country is Kyebi.<sup>1</sup> The Aquapems are extensively engaged in agriculture and in trade, both with the other tribes and with Europeans. The Ga or Acre, a clever race, greatly modified by contact with European culture, are to be found in all the towns of the West African coast as artisans and sailors. They are employed by the interior tribes as middle men and interpreters. On the right bank of the Volta are the Adangme<sup>2</sup> or Adampe, distinguished by strength and rudeness. The Crobos live in little villages in the midst of the palm tree woods which grow round about the Croboberg, an eminence about 1000 feet high.

The Tshi or Chee language<sup>3</sup> belongs to the great prefix-pronominal group. It comprises many dialects, which may, however, be reduced to two classes or types.<sup>4</sup> Akan dialects are spoken in Assini, Amanahia (Apollonia), Awini, Abanta, Wasaw, Tshuforo (Juffer or Tufel), and Denkyera in the west, and in Asen, Akem, and Aquapem in the east, as well as in the different parts of Ashantee. Fante dialects are spoken, not only in Fanti proper, but in Afutu or the country round Cape Coast, in Abora, Agymako, Akomfi, Gomoa, and Agona. The difference between the two types is not very great; a Fanti, for example, can converse without much difficulty with a native of Aquapem or Ashantee, his language being in fact a deteriorated form of the same original. Akem is considered the finest and purest of all the Akan dialects. The Aquapem, which is based on the Akem but has imbibed Fanti influences, has been made the book-language by the Basel missionaries. About a million people in all, it is estimated, speak dialects of the Tshi. The south-eastern corner of the Gold Coast is occupied by another language known as the Ga or Acre, which comprises the Ga proper and the Adangme and Crobo dialects. Ga proper is spoken by about 40,000 people, including the inhabitants of Ga and Kinkā (i.e., Dutch and British Acre, in Tshi, Nkran, and Kankan, Osu (i.e., Christiansborg), La, Tessi, Ningua, and numerous inland villages. It has been reduced to writing by the missionaries. The Adangme and Crobo dialects are spoken by about 80,000 people. They differ very considerably from Ga proper, but books printed in Ga can be used by both the Crobo and Adangme natives. Another language known as Gu is used in parts of Aquapem and in Anum beyond the Volta; but not much is known either about it or the Obutu tongue spoken in a few towns in Agona, Gomoa, and Akomfi. The dialects of the Ahanta country have still to be investigated.<sup>5</sup>

Mahometanism and Christianity are both making themselves felt to some extent among the natives of the Gold Coast. A Danish mission was started at Christiansborg about 1736 by Protten and Huckoff, the Moravian brethren. In 1835 the Wesleyan mission began its labours among the Fanti. The Basel missionaries had made a start in 1828, but it was not till 1835 that they were fairly settled at Akropong, the capital of Aquapem. They now have stations also at Kyebi, at Kukurantim, at Abune, at Abokoli, at Addah, and at Acre, and the leaders of the English expedition against the Ashantees speak very highly of their labours.

The climate of the Gold Coast is notoriously unhealthy. At Cape Coast Castle the thermometer ranges from 72° to 85° or 90°, and the amount of moisture in the atmosphere is very great. Not only are the coasts in many places lined with swamps and lagoons, but, according to Dr Gordon, the

very basis rock of the country—a granite in which iron ore and hornblende are present—gives off under the influence of the air and the rain large quantities of sulphuretted hydrogen gas. The native towns are populous and dirty, and to add to the evil it was, until the prohibition of the British authorities (at Elmina by Colonel Festing, and at Cape Coast by Governor Strahan), the custom to bury the dead in the floors of the houses. Intermittent fevers, remittent fevers (the so-called coast fever is of this class), and dysentery are the diseases most to be dreaded by the European. “The native inhabitants,” says Marcus Allen, “appear to enjoy tolerable health and to live to an average age; but in the rainy season it is not uncommon to find them suffering from pleuritis and pneumonia, rheumatic attacks, bronchitis, and catarrh.”

Though the precious dust to which the Gold Coast owes its name is no longer obtained in any considerable quantities by the rude methods of collection employed by the natives, there is abundant proof that the whole region is more or less auriferous, and it is possible that European energy and skill might make it again a real gold coast. In some parts of the country—in the neighbourhood of the Volta, for example—the surface of the ground is broken by innumerable small pits dug by the native miners.<sup>6</sup> At present the value of the territory is mainly due to the profusion of vegetable products supplied by the rich alluvial soil. Of the timber trees which abound in the vast stretches of forest, the best known are several species of the genus *bombax* (silk cotton tree, &c.), from which canoes and wooden wares are manufactured, and the odoom used for building and cabinet-work. The cocoa-nut and the palm oil are common along the coast, and the bread-fruit tree has been introduced with success at Napoleon. Indian corn, yams, cassava, sweet potatoes, tiger-nuts, ground-nuts (*Arachis hypogaea*), Guinea corn (*Sorghum vulgare*), Guinea grains (*Amonum grana-paradisi*), the egg-plant (*Solanum ovigerum*), bennie seed, oranges, limes, shaddocks, pine apples, ginger, and indigo are some of the many objects of cultivation. Nor must the kola nut be forgotten (*Sterculia acuminata*), variously styled colat, khola, and in older writers gura or gourou; for it is the favourite substitute in Western Africa for the betel nut, and forms an important article of export. Both tobacco and cotton are indigenous, but neither is cultivated by the natives. Coffee and tobacco are grown by the missionaries at Akropong.

The exports are mainly gold dust, palm oil, and palm kernels; and the imports, in exchange, dry goods from the United Kingdom, and tobacco and spirits from America. In 1875 and 1876 the exports were respectively of the value of £327,012 and £465,268, and the corresponding imports amounted to £364,672 and £446,088. The revenue of the Gold Coast, mainly derived from customs duties, was £67,368 in 1875, and £64,788 in 1876; the corresponding expenditures were £67,368 for 1875, and £93,944 for 1876. There is no public debt.

The jurisdiction of England on the Gold Coast was defined by the bond of the 6th of March 1844, an agreement with the native chiefs by which Her Majesty receives the right of trying criminals and repressing human sacrifices, panyarring, &c. The limits of the protectorate inland were not very rigidly defined. The purchase of the Danish forts in 1851, and of the Dutch forts and territory in 1871, led to the consolidation of the British power along the coast; and the Ashantee war of 1873-74 resulted in the extension of the area of British influence towards the interior. By the royal ordinances of December 1874 the selling, buying, or dealing in slaves was declared unlawful, and no person can any longer be put in pawn for debt; but those who were actually slaves at that date are left in the same state, except where cruelty can be proved against the masters.

Stanford, *Map of the Gold Coast, &c.*, 1873.

GOLDEN BULL (Latin, *BULLA AUREA*) is, in general, the designation of any charter decorated with a golden seal or *bullæ*, either from the intrinsic importance of its contents, or from the rank and dignity of the bestower or the recipient. The custom of thus giving distinction to certain documents is said to be of Byzantine origin, though if this be the case it is somewhat strange that the word employed as an equivalent for golden bull in Byzantine Greek should be the hybrid χρυσόβουλλον (cf. Codinus Curopalates, ὁ μέγας λογοθέτης διατάττει τὰ παρὰ τοῦ βασιλέως ἀποστελλόμενα προστάγματα καὶ χρυσόβουλλα πρὸς τοὺς Ῥήγας, Σουλτάνους, καὶ τοπάρχους, and Anna Comnena, *Alexiad.*, lib. iii., διὰ χρυσοβουλίου λόγου; lib. viii., χρυσόβουλλον λόγον). In Germany a Golden Bull is mentioned under the reign of Henry I. in *Chronica Cassin.*, ii. 31, and the oldest German example, if it be genuine, dates from 983. At first the golden seal was formed after the type of a solid coin, but at a later date, while the golden surface presented to the eye was greatly increased, the seal was really composed of two thin metal plates filled in with wax. The number of golden bulls issued by the imperial chancery must have been very large; the town of Frankfort, for example, still preserves no fewer than eight. But the name has become practically restricted to a few documents of unusual political importance, the golden bull of the Empire, the golden bull of Brabant, the golden bull of Hungary, and the golden bull of Milan—and of these the first is undoubtedly the golden bull *par excellence*.

It was drawn up under the direction of the emperor Charles IV., and it was formally ratified in 1356,—the first twenty-three chapters by the diet of Nuremberg (10th January), and the remaining seven by the diet of Metz (25th December). The actual redaction has been assigned to Bartolus de Saxoferrato, to Rudolf of Friedberg the imperial secretary, and even to the emperor himself; but there is no distinct authority for any of the three hypotheses as opposed to the others. A brief statement of the general purpose of its enactments has already been given at page 495 of the present volume. The exordium is a strangely rhetorical lamentation over the miseries of division, and more especially of a kingdom divided against itself, and the body of the document gives a survey of the duties, privileges, and relations of the various dignitaries of the empire, the emperor, the electors ecclesiastical and secular, the electoral plenipotentiaries, and the officers of the court. As might almost be expected, a large place is given to rules of ceremony and etiquette. At first the document was known simply as the *Lex Carolina*; but by and by the name of the Book with the Golden Bull came into use, and the present elliptical title was sufficiently established by 1417 to be officially employed in a charter by King Sigismund. The original autograph was committed to the care of the electoral prince of Mainz, as chancellor-in-chief of the empire, and it was preserved in the imperial archives at Mainz till 1789. Official transcripts were probably furnished to each of the seven electors at the time of the pro-

mulgation, and before long many of the other members of the empire secured copies for themselves. The transcript which belonged to the elector of Treves is preserved in the state archives at Stuttgart, that of the elector of Cologne in the court library at Darmstadt, and that of the elector of Bohemia in the imperial archives at Vienna. Berlin, Munich, and Dresden also boast the possession of an electoral transcript, and the town of Kitzingen has a contemporary copy in its municipal archives. There appears, however, to be good reason to doubt the genuineness of most of these so-called original transcripts. But perhaps the best known example is that of Frankfort-on-the-Main, which was procured from the imperial chancery in 1366, and is adorned with a golden seal like the original. Not only was it regularly quoted as the indubitable authority in regard to the election of the emperors in Frankfort itself, but it was from time to time officially consulted by members of the empire.

The manuscript consists of 43 leaves of parchment of medium quality, each measuring about 10½ inches in height by 7½ in breadth. The seal is of the plate and wax type. On the obverse appears a figure of the emperor seated on his throne, with the sceptre in his right hand and the globe in his left, a shield, with the crowned imperial eagle, occupies the space on the one side of the throne, and a corresponding shield, with the crowned Bohemian lion with two tails, occupies the space on the other side, and round the margin runs the legend, *Karolus quartus divina favente clementia, Romanorum imperator semper Augustus et Boemie rex*. On the reverse is a castle, with the words *Aurea Roma* on the gate, and the circumscription reads, *Roma caput Mundi Regit orbis frena rotundi*. The original Latin text of the bull was printed at Nuremberg by Creussner in 1474, and a second edition by Kobegen appeared at the same place in 1477. Since that time it has been frequently reprinted from various manuscripts and collections. Goldastus gave the Palatine text, compared with those of Bohemia and Frankfort, in his *Collectio Constitutionum Imperialium*, tom. i. Another is to be found in Onuphrius Panvinus, *De Comitibus Imperii*, and as an appendix to Cujacius, *De feudis*, and a third, of unknown history, is prefixed to the *Codex Recessuum Imperii*, printed at Mainz in 1599, and again in 1615. The Frankfort text appeared in 1742—*Aurea Bulla secundum exemplar originale Frankfurtense*—from the pen of Wolfgang Ch. Multz. German translations, none of which, however, had any official authority, were published at Nuremberg, 1474(?), at Venice, Johannus Jenson, 1476; and at Strasburg, Joh. Preussen, 1485. Among the earlier commentators of the document are Buxtoff, Dominicus Arumæus, Martinus Ruelius, H. Cammus, G. T. Dietrich, Ostermann, Speidelus, and Limmæus (*In Auream bullam*, Strasburg, 1662). The student will find a good account of the older literature of the subject in Biener, *Commentarii de origine et progressu legum Germanicarum*, 1787 (vol. ii.), and, besides the important work of Ohlen-schlager, *Neue Erläuterungen der Guldener Bulla*, Frankfurt and Leipzig, 1766, he may consult H. G. Thulemarus, *De bulla aurea argentea, &c.*, Heidelberg, 1682 (which gives the Frankfort text of the bull of Charles IV., a golden bull of Andronicus of Constantinople, the Bulla Brabantina, and the capitulation of Maximilian II.); Putters, *Staatsverfassung des deutschen Reichs*, Göttingen, 1788, Pfister, *Geschichte der Deutschen*, Hamburg, 1831 (vol. iii.), and Stobbe, *Gesch. der Deutschen Rechtsquellen*, Brunswick, 1860. A learned article on "Goldene Bulle," by H. Brandes, will be found in Ersch and Gaubert's *Encyclopædie*, 1861.

GOLDEN-EYE, a name indiscriminately given in many parts of Britain to two very distinct species of Ducks, from the rich yellow colour of their irides. The commonest of them—the *Anas fuligula* of Linnæus and *Fuligula cristata* of most modern ornithologists—is, however, usually called by English writers the Tufted Duck, while "Golden eye" is reserved in books for the *A. clangula* and *A. glaucion* of Linnæus, who did not know that the birds he so named were but examples of the same species, differing only in age or sex; and to this day many fowlers perpetuate a like mistake, deeming the "Morillon," which is the female or young male, distinct from the "Golden eye" or "Rattlewings" (as from its noisy flight they oftener call it), which is the adult male. This species belongs to the group known as Diving Ducks, and is the type of the very well-marked genus *Clangula* of later systematists, which, among other differences, has the posterior end of the sternum prolonged

so as to extend considerably over, and, we may not unreasonably suppose, protect the belly—a character possessed in a still greater degree by the Mergansers (*Mergine*), while the males also exhibit in the extraordinarily developed bony labyrinth of their trachea and its midway enlargement another resemblance to the members of the same Subfamily. The Golden-eye, *C. glaucron* of modern writers, has its home in the northern parts of both hemispheres, whence in winter it migrates southward; but as it is one of the Ducks that constantly resorts to hollow trees for the purpose of breeding it hardly transcends the limit of the Arctic forests on either continent. So well known is this habit to the people of the northern districts of Scandinavia, that they very commonly devise artificial nest-boxes for its accommodation and their own profit. Hollow logs of wood are prepared, the top and bottom closed, and a hole cut in the side. These are affixed to the trunks of living trees in suitable places, at a convenient distance from the ground, and, being readily occupied by the birds in the breeding-season, are regularly robbed, first of the numerous eggs, and finally of the down they contain, by those who have set them up.

The adult male Golden-eye is a very beautiful bird, mostly black above, but with the head, which is slightly crested, reflecting rich green lights, a large oval white patch under each eye, and elongated white scapulars; the lower parts are wholly white and the feet bright orange, except the webs, which are dusky. In the female and young male, dark brown replaces the black, the cheek-spots are indistinct, and the elongated white scapulars wanting. The Golden-eye of North America has been by some authors deemed to differ, and has been named *C. americana*, but apparently on insufficient grounds. That country, however, has, in common with Iceland, a very distinct species, *C. islandica*, often called Barrow's Duck, which is but a rare straggler to the continent of Europe, and never, so far as known, to Britain. In Iceland and Greenland it is the only habitual representative of the genus, and it occurs from thence to the Rocky Mountains. In breeding-habits it differs from the commoner species, not placing its eggs in tree-holes; but how far this difference is voluntary may be doubted, for in the countries it frequents trees are wanting. It is a larger and stouter bird, and in the male the white cheek-patches take a more crescentic form, while the head is glossed with purple rather than green, and the white scapulars are not elongated. The New World also possesses a third and still more beautiful species of the genus in *C. albeola*, known in books as the Buff-head Duck, and to American fowlers as the "Spirit-Duck" and "Butter-ball"—the former name being applied from its rapidity in diving, and the latter from its exceeding fatness in autumn. This is of small size, but the lustre of the feathers in the male is most brilliant, exhibiting a deep plum-coloured gloss on the head. It breeds in trees, and is supposed to have occurred more than once in Britain. (A. N.)

GOLDEN FLEECE. See ARGONAUTS.

GOLDEN LEGEND. See VORAGINE, JACOBUS DE.

GOLDEN ROSE (*rosa aurea*), an ornament, made of wrought gold and set with gems, which is blessed by the pope on the fourth (Lætare) Sunday of Lent, and usually afterwards sent as a mark of special favour to some distinguished individual, church, or civil community. The ceremonies which at present accompany the consecration of a golden rose are of a somewhat elaborate character, and are explained by liturgists as designed to make it specially emblematic of Christ and of the Christian graces. Some difficulty is experienced in tracing them to their ultimate origin; but the custom of blessing and sending some symbol of the kind seems to be as old at least as the time of Gregory the Great, with whom it was a frequent practice to

send persons whom he wished to flatter a few particles filed from "Peter's chains," and set in keys or crosses of gold (Greg., *Op.* ii. 648, 711, 796, 1031, ed. 1705). This practice continued to be observed for several centuries: thus we find Gregory VII., in 1079, writing to Alphonso of Castile, "Ex more sanctorum misimus vobis claviculum aureum in qua de catenis beati Petri benedictio continetur" (Mansi, *Conc. Gen.*, xii. 460). The first mention of the "golden rose," as such, is said to occur in the 11th century; and an allusion to it is certainly made in the Chronicle of William of Newburgh (1197). Pope Urban V., who sent a golden rose to Joanna of Naples in 1366, is alleged to have been the first to determine that the consecration should be annually observed. Among the very numerous recipients of this honour have been Henry VIII. of England, the famous Gonsalvo de Cordova, and, in more recent times, Napoleon III. of France and Isabella II. of Spain. The gift of the golden rose used almost invariably to accompany the coronation of the king of the Romans. If in any particular year no one is considered worthy of the rose, it is laid up in the Vatican.

GOLDFINCH (German *Goldfink*<sup>1</sup>), the *Fringilla carduelis* of Linnæus and the *Carduelis elegans* of later authors, an extremely well-known bird found over the greater parts of Europe and North Africa, and eastwards to Persia and Turkestan. Its gay plumage is matched by its sprightly nature; and together they make it one of the most favourite cage-birds among all classes. As a songster it is indeed surpassed by many other species, but its docility and ready attachment to its master or mistress make up for any defect in its vocal powers. In some parts of England the trade in Goldfinches is very considerable. In 1860 Mr Hussey reported (*Zool.*, p. 7144) the average annual captures near Worthing to exceed 11,000 dozens—nearly all being cock-birds; and a witness before a Committee of the House of Commons in 1873 stated that, when a boy, he could take forty dozens in a morning near Brighton. In these districts and others the number has of late years become much reduced, owing doubtless in part to the fatal practice of catching the birds just before or during the breeding-season; but perhaps the strongest cause of their growing scarcity throughout the kingdom is the constant breaking-up of waste lands, and the extirpation of weeds (particularly of the Order *Compositæ*) essential to the improved system of agriculture; for in many parts of Scotland, East Lothian for instance, where Goldfinches were once as plentiful as Sparrows, they are now only rare stragglers, and yet there they have not been thinned by netting. Though Goldfinches may occasionally be observed in the coldest weather, incomparably the largest number leave Britain in autumn, returning in spring, and resorting to our gardens and orchards to breed, when the lively song of the cock, and the bright yellow wings of both sexes, quickly attract the notice of even the unobservant. The nest is a beautifully neat structure, often placed at no great height from the ground, but generally so well hidden by the leafy bough on which it is built as not to be easily found, until the young being hatched, the constant visits of the parents reveal its site. When the broods leave the nest they move into the more open country, and frequenting pastures, commons, heaths, and downs, assemble in large flocks towards the end of summer. Eastward of the range of the present species its place is taken by its congener *C. caniceps*, which is easily recognized by wanting the black hood and white ear-coverts of our own bird. Its home seems to be in Central Asia, but it moves southward in winter, being common at that season in Cashmere, and is not unfrequently brought for sale to Calcutta. The position of the genus *Carduelis* in the family *Fringillidæ*

<sup>1</sup> The more common German name, however, is *Drostfink* (Thistle-Finch) or *Stieglitz*.

is not very clear. Structurally it would seem to have some relation to the Siskins (*Chrysomitris*), though the members of the two groups have very different habits, and perhaps its nearest kinship lies with the Hawfinches (*Coccothraustes*). See FINCH, vol. ix. p. 191. (A. N.)

**GOLDFISH** (*Carassius auratus*). In China and the warmer parts of Japan a fish extremely similar to the Crucian carp of Europe is of very common occurrence in ponds and other still waters. In the wild state its colours do not differ from those of a Crucian carp, and like that fish it is tenacious of life and easily domesticated. Albinos seem to be rather common; and as in other fishes (for instance, the tench, carp, eel, flounder), the colour of most of these albinos is a bright orange or golden yellow; occasionally even this shade of colour is lost, the fish being more or less pure white or silvery. The Chinese have domesticated these albinos for a long time, and by careful selection have succeeded in propagating all those strange varieties, and even monstrosities, which appear in every domestic animal. In some individuals the dorsal fin is only half its normal length, in others entirely absent; in others the anal fin has a double spine; in others all the fins are of nearly double the usual length. The snout is frequently

Goldfish (*Carassius auratus*).

malformed, giving the head of the fish an appearance similar to that of a bull-dog. The variety most highly prized at present has an extremely short snout, eyes which almost wholly project beyond the orbit, no dorsal fin, and a very long three- or four-lobed caudal fin (Telescope-fish). The gold-fish is now distributed over nearly all the civilized parts of the world. It was first brought to England in the year 1691, but was very scarce till 1728, when it was imported in great numbers from Holland, where the fish had already become domesticated. It will not thrive in rivers; in large ponds it readily reverts to the coloration of the original wild stock. It flourishes best in small tanks and ponds, in which the water is constantly changing and does not freeze; in such localities, and with a full supply of food, which consists of crumbs of bread, bran, worms, small crustaceans, and insects, it attains to a length of from 6 to 12 inches, breeding readily, sometimes at different times of the same year.

**GOLD HILL**, a town of Storey county, Nevada, United States, is situated at the head of a precipitous ravine of the Nevada mountains, 1 mile S. of Virginia city, and 328 E. from San Francisco by rail. The name was derived from a small hill connected with the famous Comstock lode, and containing rich golden ore. Some of the most valuable mines of this lode are within the limits of the town, the average yield being about two million dollars monthly in gold and silver. Though there are some quartz mills within the town, the greater part of the ore is conveyed to the mills on Carson river. There is a fine hall in connexion

with the miners' union, and another has been erected by the Oddfellows and Freemasons. The Methodists, Episcopalians, and Roman Catholics are the principal denominations of the town. Gold Hill obtains its water supply in conjunction with Virginia from the summit of the Sierra Nevada, 25 miles distant. The population in 1860 was 638, and in 1870 4311. Since then it has been rapidly increasing, and must have more than trebled its numbers.

**GOLDINGEN**, in Lettish KULDIGA, a district town of the Russian province of Courland, in 50° 58' N. lat. and 11° 58' E. long., 85 miles W.N.W. of Mittau, on the left bank of the Windau, which forms a beautiful waterfall—the Rummel—in the neighbourhood. On the Schlossberg or Castlehill are a few remains of the foundations of what in the end of the 18th century was the most magnificent ruin in Courland, and in the 17th century had been the palatial residence of the dukes. The town is beautifully built; and it possesses a Lutheran church dating from 1606, and a Catholic church five years older, a hospital and two almshouses, two benevolent societies, founded respectively in 1836 and 1839, and a society of rural economy. Brush-making is the only local industry of much importance. In 1861 the population was 5475 (2764 males), of whom the greater proportion were Lutherans, 1551 being Jews, 360 Roman Catholics, and 290 members of the Greek Church; but according to the *St Petersburg Calendar* for 1878 it has diminished to 4758. The castle of Goldingen was founded in 1249 by Dietrich of Groningen, and in 1347 the town received its first charter of privileges from Goswin von Gerike, master of the Teutonic order. It has been a district town since 1795.

**GOLD LACE.** See under GOLD, p. 753.

**GOLDONI**, CARLO (1707–1793), the most illustrious of the Italian comedy-writers, and the real founder of modern Italian comedy. His life is known to us from his *Mémoires*, which, though they do not reveal a great thinker, are of great value as faithfully representing the Italian society, especially the Venetian society of the 18th century. Goldoni was born at Venice in 1707, in a fine house near St Thomas's church. His father Giulio was a native of Modena. The first playthings of the future writer were puppets which he made dance; the first books he read were plays,—among others, the comedies of the Florentine Cicognini. Later he received a still stronger impression from the *Mandragora* of Macchiavelli. At eight years old he had tried to sketch a play. His father, meanwhile, had taken his degree in medicine at Rome and fixed himself at Perugia, where he made his son join him; but, having soon quarrelled with his colleagues in medicine, he departed for Chioggia, leaving his son to the care of a philosopher, Professor Caldini of Rimini. The young Goldoni soon grew tired of his life at Rimini, and ran away with a Venetian company of players. He began to study law at Venice, then went to continue the same pursuit at Pavia, but at that time he was studying the Greek and Latin comic poets much more and much better than books about law. "I have read over again," he writes in his *Mémoires*, "the Greek and Latin poets, and I have told to myself that I should like to imitate them in their style, their plots, their precision; but I would not be satisfied unless I succeeded in giving more interest to my works, happier issues to my plots, better drawn characters, and more genuine comedy." For a satire entitled *Il Colosso*, which attacked the honour of several families of Pavia, he was driven from that town, and went first to study with the juriconsult Morelli at Udine, then to take his degree in law at Modena. After having worked some time as clerk in the chanceries of Chioggia and Feltre, his father being dead, he went to Venice, to exercise there his profession as a lawyer. But the wish to write for the stage was always strong in

him, and he tried to do so ; he made, however, a mistake in his choice, and began with a tragedy, *Amalasunta*, which was represented at Milan and proved a failure. In 1734 he wrote another tragedy, *Belisario*, which though not much better, chanced nevertheless to please the public. This first success encouraged him to write other tragedies, some of which were well received ; but the author himself saw clearly that he had not yet found his proper sphere, and that a radical dramatic reform was absolutely necessary for the stage. He wished to create a characteristic comedy in Italy, to follow the example of Molière, and to delineate the realities of social life in as natural a manner as possible. His first essay of this kind was *Momolo Cortesano* (Momolo the Courtier), written in the Venetian dialect, and based on his own experience. Other plays followed—some interesting from their subject, others from the characters ; the best of that period are—*Le trentadue Disgrazie d'Arlecchino*, *La Notte critica*, *La Bancarotta*, *La Donna di Garbo*. Having, while consul of Genoa at Venice, been cheated by a captain of Ragusa, he founded on this his play *L'Impostore*. At Leghorn he made the acquaintance of the comedian Medebac, and followed him to Venice, with his company, for which he began to write his best plays. Once he promised to write sixteen comedies in a year, and kept his word ; among the sixteen are some of his very best, such as *Il Caffè*, *Il Bugiardo*, *La Pamela*. When he left the company of Medebac, he passed over to that maintained by the patrician Vendramin, continuing to write with the greatest facility. In 1761 he was called to Paris, and before leaving Venice he wrote *Una delle ultime Sere di Carnevale* (One of the Last Nights of Carnival), an allegorical comedy in which he said good-bye to his country. At the end of the representation of this play, the theatre resounded with applause, and with shouts expressive of good wishes. Goldoni, at this proof of public sympathy, wept as a child. At Paris, during two years, he wrote comedies for the Italian actors ; then he taught Italian to the royal princesses ; and for the wedding of Louis XVI. and of Marie Antoinette he wrote in French one of his best comedies, *Le Bourru Bienfaisant*, which was a great success. When he retired from Paris to Versailles, the king made him a gift of 6000 francs, and fixed on him an annual pension of 1200 francs. It was at Versailles he wrote his *Memoirs*, which occupied him till he reached his eightieth year. The Revolution deprived him all at once of his modest pension, and reduced him to extreme misery ; he dragged on his unfortunate existence till 1793, and died on the 6th of February. The day after, on the proposal of André Chénier, the Convention agreed to give the pension back to the poet ; and as he had already died, a reduced allowance was granted to his widow.

The best comedies of Goldoni are—*La Donna di Garbo*, *La Bottega di Caffè*, *Pamela nubile*, *Le Baruffe Riozzotte*, *I Rusteghi*, *Todero Brontolon*, *Gli Innamorati*, *Il Ventaglio*, *Il Bugiardo*, *La Casa Nova*, *Il Burbero benefico*, *La Locandiera*. See P. G. Molmenti, *Carlo Goldoni*, Venice, 1875.

GOLDSCHMIDT, HERMANN (1802–1866), a German painter and astronomer, was the son of a Jewish merchant, and was born at Frankfort on the 17th June 1802. He for ten years assisted his father in his business ; but, his love of art having been awakened while journeying in Holland, he in 1832 began the study of painting at Munich under Cornelius and Schnorr, and in 1836 established himself at Paris, where he painted a number of pictures of more than average merit, among which may be mentioned the Cumæan Sibyl, 1844 ; an Offering to Venus, 1845 ; a View of Rome, 1849 ; the Death of Romeo and Juliet, 1857 ; and several Alpine landscapes. In 1847 he began to devote his attention to astronomy ; and from 1852 to 1861 he discovered fourteen asteroids between Mars and Jupiter, on which

account he received the grand astronomical prize from the Academy of Sciences. His observations of the protuberances on the sun, made during the total eclipse on the 10th July 1860, are included in the work of Mädler on the eclipse, published in 1861. Goldschmidt died at Fontainebleau, 26th August 1866.

GOLDSMITH, OLIVER (1728–1774), one of the most pleasing English writers of the 18th century. He was of a Protestant and Saxon family which had been long settled in Ireland, and which had, like most other Protestant and Saxon families, been, in troubled times, harassed and put in fear by the native population. His father, Charles Goldsmith, studied in the reign of Queen Anne at the diocesan school of Elphin, became attached to the daughter of the schoolmaster, married her, took orders, and settled at a place called Pallas, in the county of Longford. There he with difficulty supported his wife and children on what he could earn, partly as a curate and partly as a farmer.

At Pallas Oliver Goldsmith was born in November 1728. That spot was then, for all practical purposes, almost as remote from the busy and splendid capital in which his later years were passed as any clearing in Upper Canada or any sheep walk in Australasia now is. Even at this day those enthusiasts who venture to make a pilgrimage to the birthplace of the poet are forced to perform the latter part of their journey on foot. The hamlet lies far from any high road, on a dreary plain which, in wet weather, is often a lake. The lanes would break any jaunting car to pieces ; and there are ruts and sloughs through which the most strongly built wheels cannot be dragged.

While Oliver was still a child his father was presented to a living worth about £200 a year, in the county of West Meath. The family accordingly quitted their cottage in the wilderness for a spacious house on a frequented road, near the village of Lissoy. Here the boy was taught his letters by a maid-servant, and was sent in his seventh year to a village school kept by an old quartermaster on half-pay, who professed to teach nothing but reading, writing, and arithmetic, but who had an inexhaustible fund of stories about ghosts, banshees, and fairies, about the great Rapparee chiefs, Baldearg O'Donnell and galloping Hogan, and about the exploits of Peterborough and Stanhope, the surprise of Monjuich, and the glorious disaster of Brihuega. This man must have been of the Protestant religion ; but he was of the aboriginal race, and not only spoke the Irish language, but could pour forth unpremeditated Irish verses. Oliver early became, and through life continued to be, a passionate admirer of the Irish music, and especially of the compositions of Carolan, some of the last notes of whose harp he heard. It ought to be added that Oliver, though by birth one of the Englishry, and though connected by numerous ties with the Established Church, never showed the least sign of that contemptuous antipathy with which, in his days, the ruling minority in Ireland too generally regarded the subject majority. So far indeed was he from sharing in the opinions and feelings of the caste to which he belonged that he conceived an aversion to the Glorious and Immortal Memory, and, even when George III. was on the throne, maintained that nothing but the restoration of the banished dynasty could save the country.

From the humble academy kept by the old soldier Goldsmith was removed in his ninth year. He went to several grammar-schools, and acquired some knowledge of the ancient languages. His life at this time seems to have been far from happy. He had, as appears from the admirable portrait of him at Knowle, features harsh even to ugliness. The small-pox had set its mark on him with more than usual severity. His stature was small, and his limbs ill

put together. Among boys little tenderness is shown to personal defects; and the ridicule excited by poor Oliver's appearance was heightened by a peculiar simplicity and a disposition to blunder which he retained to the last. He became the common butt of boys and masters, was pointed at as a fright in the play-ground, and flogged as a dunce in the school-room. When he had risen to eminence, those who had once derided him ransacked their memory for the events of his early years, and recited repartees and couplets which had dropped from him, and which, though little noticed at the time, were supposed, a quarter of a century later, to indicate the powers which produced the *Vicar of Wakefield* and the *Deserted Village*.

In his seventeenth year Oliver went up to Trinity College, Dublin, as a sizar. The sizars paid nothing for food and tuition, and very little for lodging; but they had to perform some menial services from which they have long been relieved. They swept the court, they carried up the dinner to the fellows' table, and changed the plates and poured out the ale of the rulers of the society. Goldsmith was quartered, not alone, in a garret, on the window of which his name, scrawled by himself, is still read with interest. From such garrets many men of less parts than his have made their way to the woolsack or to the episcopal bench. But Goldsmith, while he suffered all the humiliations, threw away all the advantages of his situation. He neglected the studies of the place, stood low at the examinations, was turned down to the bottom of his class for playing the buffoon in the lecture-room, was severely reprimanded for pumping on a constable, and was caned by a brutal tutor for giving a ball in the attic story of the college to some gay youths and damsels from the city.

While Oliver was leading at Dublin a life divided between squalid distress and squalid dissipation, his father died, leaving a mere pittance. The youth obtained his bachelor's degree, and left the university. During some time the humble dwelling to which his widowed mother had retired was his home. He was now in his twenty-first year; it was necessary that he should do something; and his education seemed to have fitted him to do nothing but to dress himself in gaudy colours, of which he was as fond as a magpie, to take a hand at cards, to sing Irish airs, to play the flute, to angle in summer, and to tell ghost stories by the fire in winter. He tried five or six professions in turn without success. He applied for ordination; but, as he applied in scarlet clothes, he was speedily turned out of the episcopal palace. He then became tutor in an opulent family, but soon quitted his situation in consequence of a dispute about play. Then he determined to emigrate to America. His relations, with much satisfaction, saw him set out for Cork on a good horse, with £30 in his pocket. But in six weeks he came back on a miserable hack, without a penny, and informed his mother that the ship in which he had taken his passage, having got a fair wind while he was at a party of pleasure, had sailed without him. Then he resolved to study the law. A generous kinsman advanced £50. With this sum Goldsmith went to Dublin, was enticed into a gaming house, and lost every shilling. He then thought of medicine. A small purse was made up; and in his twenty-fourth year he was sent to Edinburgh. At Edinburgh he passed eighteen months in nominal attendance on lectures, and picked up some superficial information about chemistry and natural history. Thence he went to Leyden, still pretending to study physic. He left that celebrated university, the third university at which he had resided, in his twenty-seventh year, without a degree, with the merest smattering of medical knowledge, and with no property but his clothes and his flute. His flute, however, proved a useful friend. He rambled on foot through Flanders, France, and Switzerland, playing tunes

which everywhere set the peasantry dancing, and which often procured for him a supper and a bed. He wandered as far as Italy. His musical performances, indeed, were not to the taste of the Italians; but he contrived to live on the alms which he obtained at the gates of convents. It should, however, be observed that the stories which he told about this part of his life ought to be received with great caution; for strict veracity was never one of his virtues; and a man who is ordinarily inaccurate in narration is likely to be more than ordinarily inaccurate when he talks about his own travels. Goldsmith indeed was so regardless of truth as to assert in print that he was present at a most interesting conversation between Voltaire and Fontenelle, and that this conversation took place at Paris. Now it is certain that Voltaire never was within a hundred leagues of Paris during the whole time which Goldsmith passed on the Continent.

In 1756 the wanderer landed at Dover, without a shilling, without a friend, and without a calling. He had indeed, if his own unsupported evidence may be trusted, obtained from the university of Padua a doctor's degree; but this dignity proved utterly useless to him. In England his flute was not in request; there were no convents; and he was forced to have recourse to a series of desperate expedients. He turned strolling player; but his face and figure were ill suited to the boards even of the humblest theatre. He pounded drugs and ran about London with phials for charitable chemists. He joined a swarm of beggars, which made its nest in Axe Yard. He was for a time usher of a school, and felt the miseries and humiliations of this situation so keenly that he thought it a promotion to be permitted to earn his bread as a bookseller's hack; but he soon found the new yoke more galling than the old one, and was glad to become an usher again. He obtained a medical appointment in the service of the East India Company; but the appointment was speedily revoked. Why it was revoked we are not told. The subject was one on which he never liked to talk. It is probable that he was incompetent to perform the duties of the place. Then he presented himself at Surgeon's Hall for examination, as mate to a naval hospital. Even to so humble a post he was found unequal. By this time the schoolmaster whom he had served for a morsel of food and the third part of a bed was no more. Nothing remained but to return to the lowest drudgery of literature. Goldsmith took a garret in a miserable court, to which he had to climb from the brink of Fleet Ditch by a dizzy ladder of flagstones called Breakneck Steps. The court and the ascent have long disappeared, but old Londoners well remember both. Here, at thirty, the unlucky adventurer sat down to toil like a galley slave.

In the succeeding six years he sent to the press some things which have survived, and many which have perished. He produced articles for reviews, magazines, and newspapers; children's books, which, bound in gilt paper and adorned with hideous woodcuts, appeared in the window of the once far-famed shop at the corner of Saint Paul's Churchyard; *An Inquiry into the State of Polite Learning in Europe*, which, though of little or no value, is still reprinted among his works; a *Life of Beau Nash*, which is not reprinted, though it well deserves to be so; a superficial and incorrect, but very readable, *History of England*, in a series of letters purporting to be addressed by a nobleman to his son; and some very lively and amusing *Sketches of London Society*, in a series of letters purporting to be addressed by a Chinese traveller to his friends. All these works were anonymous; but some of them were well known to be Goldsmith's; and he gradually rose in the estimation of the booksellers for whom he drudged. He was, indeed, emphatically a popular writer. For

accurate research or grave disquisition he was not well qualified by nature or by education. He knew nothing accurately, his reading had been desultory, nor had he meditated deeply on what he had read. He had seen much of the world, but he had noticed and retained little more of what he had seen than some grotesque incidents and characters which had happened to strike his fancy. But, though his mind was very scantily stored with materials, he used what materials he had in such a way as to produce a wonderful effect. There have been many greater writers, but perhaps no writer was ever more uniformly agreeable. His style was always pure and easy, and, on proper occasions, pointed and energetic. His narratives were always amusing, his descriptions always picturesque, his humour rich and joyous, yet not without an occasional tinge of amiable sadness. About everything that he wrote, serious or sportive, there was a certain natural grace and decorum, hardly to be expected from a man a great part of whose life had been passed among thieves and beggars, street walkers and merryandrews, in those squalid dens which are the reproach of great capitals.

As his name gradually became known, the circle of his acquaintance widened. He was introduced to Johnson, who was then considered as the first of living English writers, to Reynolds, the first of English painters, and to Burke, who had not yet entered parliament, but had distinguished himself greatly by his writings and by the eloquence of his conversation. With these eminent men Goldsmith became intimate. In 1763 he was one of the nine original members of that celebrated fraternity which has sometimes been called the Literary Club, but which he always disclaimed that epithet, and still glories in the simple name of the Club.

By this time Goldsmith had quitted his miserable dwelling at the top of Breakneck Steps, and had taken chambers in the more civilized region of the Inns of Court. But he was still often reduced to pitiable shifts. Towards the close of 1764 his rent was so long in arrear that his landlady one morning called in the help of a sheriff's officer. The debtor, in great perplexity, despatched a messenger to Johnson, and Johnson, always friendly, though often surly sent back the messenger with a guinea, and promised to follow speedily. He came, and found that Goldsmith had changed the guinea, and was railing at the landlady over a bottle of Madeira. Johnson put the cork into the bottle, and entreated his friend to consider calmly how money was to be procured. Goldsmith said that he had a novel ready for the press. Johnson glanced at the manuscript, saw that there were good things in it, took it to a bookseller, sold it for £60, and soon returned with the money. The rent was paid, and the sheriff's officer with drew. According to one story, Goldsmith gave his landlady a sharp reprimand for her treatment of him; according to another, he insisted on her joining him in a bowl of punch. Both stories are probably true. The novel which was thus ushered into the world was the *Vicar of Wakefield*.

But before the *Vicar of Wakefield* appeared in print, came the great crisis of Goldsmith's literary life. In Christmas week 1764 he published a poem, entitled the *Traveller*. It was the first work to which he had put his name, and it at once raised him to the rank of a legitimate English classic. The opinion of the most skilful critics was that nothing finer had appeared in verse since the fourth book of the *Dunciad*. In one respect the *Traveller* differs from all Goldsmith's other writings. In general his designs were bad, and his execution good. In the *Traveller*, the execution, though deserving of much praise, is far inferior to the design. No philosophical poem, ancient or modern, has a plan so noble, and at the same

time so simple. An English wanderer, seated on a crag among the Alps, near the point where three great countries meet, looks down on the boundless prospect, reviews his long pilgrimage, recalls the varieties of scenery, of climate, of government, of religion, of national character, which he has observed, and comes to the conclusion, just and unjust, that our happiness depends little on political institutions, and much on the temper and regulation of our own minds.

While the fourth edition of the *Traveller* was on the counters of the booksellers, the *Town of Wakefield* appeared, and rapidly obtained a popularity which has lasted down to our own time and which is likely to last as long as our language. The fable is indeed one of the worst that ever was constructed. It wants, not merely that probability which ought to be found in a tale of common English life, but that consistency which ought to be found even in the wildest fiction about witches, gnomes, and fairies. But the earlier chapters have all the sweetness of pastoral poetry, together with all the vivacity of comedy. Mose and his spectacles, the vicar and his monomania, the shaver and his cosmogony, the squire proving from Aristotle that relatives are related, Olivia preparing herself for the arduous task of converting a Turkish lover by studying the controversy between Robinson Crusoe and Friday, the great ladies with their scandal about Sir Tomkyns' amours and Dr Burdock's verses, and Mr Burchell with his "I judge," have caused as much harmless mirth as has ever been caused by matter packed into so small a number of pages. The latter part of the tale is unworthy of the beginning. As we approach the catastrophe, the absurdities become thicker and thicker, and the gleams of pleasantry become rarer and rarer.

The success which had attended Goldsmith as a novelist emboldened him to try his fortune as a dramatist. He wrote the *Goodnatural Man*, a piece which had a worse fate than it deserved. Garrick refused to produce it at Drury Lane. It was acted at Covent Garden in 1768, but was coldly received. The author, however, cleared by his benefit nights, and by the sale of the copyright, no less than £500, five times as much as he had made by the *Traveller* and the *Vicar of Wakefield* together. The plot of the *Goodnatural Man* is, like almost all Goldsmith's plots, very ill constructed. But some passages are exquisitely ludicrous,—much more ludicrous indeed than suited the taste of the town at that time. A caustic, mawkish play, entitled *False Delicacy*, had just had an immense run. Sentimentality was all the mode. During some years, more tears were shed at comedies than at tragedies, and a pleasantry which moved the audience to anything more than a grave smile was reprobated as low. It is not strange, therefore, that the very best scene in the *Goodnatural Man*, that in which Miss Richland finds her lover attended by the bailiff and the bailiff's follower in full court dresses, should have been mercilessly hissed, and should have been omitted after the first night.

In 1770 appeared the *Deserted Village*. In mere diction and versification this celebrated poem is fully equal, perhaps superior, to the *Traveller*, and it is generally preferred to the *Traveller* by that large class of readers who think, with Bayes in the *Rehearsal*, that the only use of a plan is to bring in fine things. More discerning judges, however, while they admire the beauty of the details, are shocked by one unpardonable fault which pervades the whole. The fault which we mean is not that theory about wealth and luxury which has so often been censured by political economists. The theory is indeed false, but the poem, considered merely as a poem, is not necessarily the worse on that account. The finest poem in the Latin language,—indeed, the finest didactic poem in any language,—was written in defence of the silliest and meanest of all

systems of natural and moral philosophy. A poet may easily be pardoned for reasoning ill; but he cannot be pardoned for describing ill, for observing the world in which he lives so carelessly that his portraits bear no resemblance to the originals, for exhibiting as copies from real life monstrous combinations of things which never were and never could be found together. What would be thought of a painter who should mix August and January in one landscape, who should introduce a frozen river into a harvest scene? Would it be a sufficient defence of such a picture to say that every part was exquisitely coloured, that the green hedges, the apple-trees loaded with fruit, the waggon reeling under the yellow sheaves, and the sun-burned reapers wiping their foreheads were very fine, and that the ice and the boys sliding were also very fine? To such a picture the *Deserted Village* bears a great resemblance. It is made up of incongruous parts. The village in its happy days is a true English village. The village in its decay is an Irish village. The felicity and the misery which Goldsmith has brought close together belong to two different countries, and to two different stages in the progress of society. He had assuredly never seen in his native island such a rural paradise, such a seat of plenty, content, and tranquillity, as his Auburn. He had assuredly never seen in England all the inhabitants of such a paradise turned out of their homes in one day, and forced to emigrate in a body to America. The hamlet he had probably seen in Kent; the ejectionment he had probably seen in Munster; but by joining the two, he has produced something which never was and never will be seen in any part of the world.

In 1773 Goldsmith tried his chance at Covent Garden with a second play, *She Stoops to Conquer*. The manager was, not without great difficulty, induced to bring this piece out. The sentimental comedy still reigned, and Goldsmith's comedies were not sentimental. The *Goodnatured Man* had been too funny to succeed; yet the mirth of the *Goodnatured Man* was sober when compared with the rich drollery of *She Stoops to Conquer*, which is, in truth, an incomparable farce in five acts. On this occasion, however, genius triumphed. Pit, boxes, and galleries were in a constant roar of laughter. If any bigoted admirer of Kelly and Cumberland ventured to hiss or groan, he was speedily silenced by a general cry of "turn him out," or "throw him over." Two generations have since confirmed the verdict which was pronounced on that night.

While Goldsmith was writing the *Deserted Village* and *She Stoops to Conquer*, he was employed on works of a very different kind,—works from which he derived little reputation but much profit. He compiled for the use of schools a *History of Rome*, by which he made £300; a *History of England*, by which he made £600; a *History of Greece*, for which he received £250; a *Natural History*, for which the booksellers covenanted to pay him 800 guineas. These works he produced without any elaborate research, by merely selecting, abridging, and translating into his own clear, pure, and flowing language, what he found in books well known to the world, but too bulky or too dry for boys and girls. He committed some strange blunders, for he knew nothing with accuracy. Thus, in his *History of England*, he tells us that Naseby is in Yorkshire; nor did he correct this mistake when the book was reprinted. He was very nearly hoaxed into putting into the *History of Greece* an account of a battle between Alexander the Great and Montezuma. In his *Animated Nature* he relates, with faith and with perfect gravity, all the most absurd lies which he could find in books of travels about gigantic Patagonians, monkeys that preach sermons, nightingales that repeat long conversations. "If he can tell a horse from a cow," said Johnson, "that is the extent of his knowledge of zoology." How little Goldsmith was qualified to

write about the physical sciences is sufficiently proved by two anecdotes. He on one occasion denied that the sun is longer in the northern than in the southern signs. It was vain to cite the authority of Maupertuis. "Maupertuis!" he cried, "I understand those matters better than Maupertuis." On another occasion he, in defiance of the evidence of his own senses, maintained obstinately, and even angrily, that he chewed his dinner by moving his upper jaw.

Yet, ignorant as Goldsmith was, few writers have done more to make the first steps in the laborious road to knowledge easy and pleasant. His compilations are widely distinguished from the compilations of ordinary bookmakers. He was a great, perhaps an unequalled, master of the arts of selection and condensation. In these respects his histories of Rome and of England, and still more his own abridgments of these histories, well deserved to be studied. In general nothing is less attractive than an epitome; but the epitomes of Goldsmith, even when most concise, are always amusing; and to read them is considered by intelligent children not as a task but as a pleasure.

Goldsmith might now be considered as a prosperous man. He had the means of living in comfort, and even in what to one who had so often slept in barns and on bulks must have been luxury. His fame was great and was constantly rising. He lived in what was intellectually far the best society of the kingdom, in a society in which no talent or accomplishment was wanting, and in which the art of conversation was cultivated with splendid success. There probably were never four talkers more admirable in four different ways than Johnson, Burke, Beauclerk, and Garrick; and Goldsmith was on terms of intimacy with all the four. He aspired to share in their colloquial renown, but never was ambition more unfortunate. It may seem strange that a man who wrote with so much perspicuity, vivacity, and grace should have been, whenever he took a part in conversation, an empty, noisy, blundering rattle. But on this point the evidence is overwhelming. So extraordinary was the contrast between Goldsmith's published works and the silly things which he said, that Horace Walpole described him as an inspired idiot. "Noll," said Garrick, "wrote like an angel, and talked like poor Poll." Chamier declared that it was a hard exercise of faith to believe that so foolish a chatterer could have really written the *Traveller*. Even Boswell could say, with contemptuous compassion, that he liked very well to hear honest Goldsmith run on. "Yes, sir," said Johnson, "but he should not like to hear himself." Minds differ as rivers differ. There are transparent and sparkling rivers from which it is delightful to drink as they flow; to such rivers the minds of such men as Burke and Johnson may be compared. But there are rivers of which the water when first drawn is turbid and noisome, but becomes pellucid as crystal and delicious to the taste, if it be suffered to stand till it has deposited a sediment; and such a river is a type of the mind of Goldsmith. His first thoughts on every subject were confused even to absurdity, but they required only a little time to work themselves clear. When he wrote they had that time, and therefore his readers pronounced him a man of genius; but when he talked he talked nonsense, and made himself the laughing-stock of his hearers. He was painfully sensible of his inferiority in conversation; he felt every failure keenly; yet he had not sufficient judgment and self-command to hold his tongue. His animal spirits and vanity were always impelling him to try to do the one thing which he could not do. After every attempt he felt that he had exposed himself, and writhed with shame and vexation; yet the next moment he began again.

His associates seem to have regarded him with kindness, which, in spite of their admiration of his writings, was not

unmixed with contempt. In truth, there was in his character much to love, but very little to respect. His heart was soft even to weakness: he was so generous that he quite forgot to be just; he forgave injuries so readily that he might be said to invite them, and was so liberal to beggars that he had nothing left for his tailor and his butcher. He was vain, sensual, frivolous, profuse, imprudent. One vice of a darker shade was imputed to him, envy. But there is not the least reason to believe that this bad passion, though it sometimes made him wince and utter fretful exclamations, ever impelled him to injure by wicked arts the reputation of any of his rivals. The truth probably is that he was not more envious, but merely less prudent, than his neighbours. His heart was on his lips. All those small jealousies, which are but too common among men of letters, but which a man of letters who is also a man of the world does his best to conceal, Goldsmith avowed with the simplicity of a child. When he was envious, instead of affecting indifference, instead of damning with faint praise, instead of doing injuries slyly and in the dark, he told everybody that he was envious. "Do not, pray, do not, talk of Johnson in such terms," he said to Boswell; "you harrow up my very soul." George Stevens and Cumberland were men far too cunning to say such a thing. They would have echoed the praises of the man whom they envied, and then have sent to the newspapers anonymous libels upon him. Both what was good and what was bad in Goldsmith's character was to his associates a perfect security that he would never commit such villainy. He was neither ill-natured enough, nor long-headed enough, to be guilty of any malicious act which required contrivance and disguise.

Goldsmith has sometimes been represented as a man of genius, cruelly treated by the world, and doomed to struggle with difficulties, which at last broke his heart. But no representation can be more remote from the truth. He did, indeed, go through much sharp misery before he had done anything considerable in literature. But after his name had appeared on the title-page of the *Traveller*, he had none but himself to blame for his distresses. His average income, during the last seven years of his life, certainly exceeded £400 a year, and £400 a year ranked, among the incomes of that day, at least as high as £800 a year would rank at present. A single man living in the Temple, with £400 a year, might then be called opulent. Not one in ten of the young gentlemen of good families who were studying the law there had so much. But all the wealth which Lord Clive had brought from Bengal, and Sir Lawrence Dundas from Germany, joined together, would not have sufficed for Goldsmith. He spent twice as much as he had. He wore fine clothes, gave dinners of several courses, paid court to venal beauties. He had also, it should be remembered, to the honour of his heart, though not of his head, a guinea, or five, or ten, according to the state of his purse, ready for any tale of distress, true or false. But it was not in dress or feasting, in promiscuous amours or promiscuous charities, that his chief expense lay. He had been from boyhood a gambler, and at once the most sanguine and the most unskilful of gamblers. For a time he put off the day of inevitable ruin by temporary expedients. He obtained advances from booksellers, by promising to execute works which he never began. But at length this source of supply failed. He owed more than £2000; and he saw no hope of extrication from his embarrassments. His spirits and health gave way. He was attacked by a nervous fever, which he thought himself competent to treat. It would have been happy for him if his medical skill had been appreciated as justly by himself as by others. Notwithstanding the degree which he pretended to have received at Padua, he could procure no

patients. "I do not practise," he once said; "I make it a rule to prescribe only for my friends." "Pray, dear Doctor," said Beaucherk, "alter your rule; and prescribe only for your enemies." Goldsmith now, in spite of this excellent advice, prescribed for himself. The remedy aggravated the malady. The sick man was induced to call in real physicians; and they at one time imagined that they had cured the disease. Still his weakness and restlessness continued. He could get no sleep. He could take no food. "You are worse," said one of his medical attendants, "than you should be from the degree of fever which you have. Is your mind at ease?" "No; it is not," were the last recorded words of Oliver Goldsmith. He died on the 3d of April 1774, in his forty-sixth year. He was laid in the churchyard of the Temple; but the spot was not marked by any inscription, and is now forgotten. The coffin was followed by Burke and Reynolds. Both these great men were sincere mourners. Burke, when he heard of Goldsmith's death, had burst into a flood of tears. Reynolds had been so much moved by the news that he had flung aside his brush and palette for the day.

A short time after Goldsmith's death, a little poem appeared, which will, as long as our language lasts, associate the names of his two illustrious friends with his own. It has already been mentioned that he sometimes felt keenly the sarcasm which his wild blundering talk brought upon him. He was, not long before his last illness, provoked into retaliating. He wisely betook himself to his pen; and at that weapon he proved himself a match for all his assailants together. Within a small compass he drew with a singularly easy and vigorous pencil the characters of nine or ten of his intimate associates. Though this little work did not receive his last touches, it must always be regarded as a masterpiece. It is impossible, however, not to wish that four or five likenesses which have no interest for posterity were wanting to that noble gallery, and that their places were supplied by sketches of Johnson and Gibbon, as happy and vivid as the sketches of Burke and Garrick.

Some of Goldsmith's friends and admirers honoured him with a cenotaph in Westminster Abbey. Nolteken was the sculptor, and Johnson wrote the inscription. It is much to be lamented that Johnson did not leave to posterity a more durable and a more valuable memorial of his friend. A life of Goldsmith would have been an inestimable addition to the Lives of the Poets. No man appreciated Goldsmith's writings more justly than Johnson; no man was better acquainted with Goldsmith's character and habits; and no man was more competent to delineate with truth and spirit the peculiarities of a mind in which great powers were found in company with great weaknesses. But the list of poets to whose works Johnson was requested by the booksellers to furnish prefaces ended with Lyttelton, who died in 1773. The line seems to have been drawn expressly for the purpose of excluding the person whose portrait would have most fitly closed the series. Goldsmith, however, has been fortunate in his biographers. Within a few years his life was written by Mr Prior (1836), by Mr Washington Irving (1849), and by Mr Forster (1848; 2d ed., 1854). The diligence of Mr Prior deserves great praise; the style of Mr Washington Irving is always pleasing; but the highest place must, in justice, be assigned to the eminently interesting work of Mr Forster. (M.)

GOLDSTÜCKER, THEODOR (1821-1872), an eminent Sanskrit scholar, was born of Jewish parents at Königsberg on the 18th of January 1821, and, after passing through a prolonged course of study at the gymnasium, entered the university in 1836, where he attended the lectures of Lobeck, Rosenkranz, and Von Bohlen, under the last of whom he began the study of Sanskrit. In 1838 he removed to Bonn, where he heard W. von Schlegel, Lassen, and

Freytag; and after graduating at Königsberg in 1840, he proceeded to Paris, where he heard the lectures and enjoyed the friendship of Burnouf, and where in 1842 he edited a German translation of the *Prabodha Chandrodaya*. From 1846 to 1850 he resided at Berlin, where his talents and scholarship were recognized by A. von Humboldt; in the latter year he was induced, for the further prosecution of his Sanskrit researches, to remove to London, where in 1851 he was appointed professor of Sanskrit in University College. He now began to devote himself to the execution of a new Sanskrit dictionary, of which the first instalment appeared in 1856. In 1861 he published an important monograph, entitled *Panini: his Place in Literature*; and from 1866 he was one of the chief promoters of the Sanskrit Text Society, which had been founded in that year; he was also an active member of the Philological Society, and of other learned bodies. His literary productiveness was not, however, proportionate to the extent and accuracy of his reading; he had "allowed his learning to stifle his creative faculty," and a morbid dread of the risk of making inaccurate or defective statements made him unduly reluctant to communicate to the world the results of his laborious collecting and collating. The dictionary, —so copious as almost to deserve the name of a cyclopædia of Indian archaeology, —was never advanced further than to about the middle of the first letter (1864); and whatever else he may have written was published anonymously in various periodicals and works of reference. He died on the 6th of March 1872.

GOLF (in its older forms GOLF, GOLF, or GOLF, the last of which gives the genuine old pronunciation) is an amusement so peculiar to Scotland and so prevalent there that—unless curling may be held to dispute the place with it—it may be called, *par excellence*, the national game. There seems little doubt the word is derived from the German *kolbe*, a club—in Dutch, *kolf*,—which last is nearly in sound identical, and might give inference for the game of a Dutch origin.<sup>1</sup>

Golf may be practised on any good stretch of meadow-land, where the grass is not too rank; but the ground best suited for the purpose is a reach of undulating down-country, such as is common on the seaboard,—sandy in soil, and as such covered with a short crisp turf, occasionally broken up by sandholes or "bunkers," and provided, in addition, with a fair supply of gorse or whin. These "bunkers" and whins constitute the main "hazards" of the game, in the avoidance of which skill in it is specially shown; and without a fair provision of them, no golfing "links" or "green" can be held to approach the ideal standard. Small holes, of about 4 inches diameter, are punched in the turf at distances indefinitely variable, but ranging from about 100 to 400 or 500 yards; and from one of these holes into the next in order, a ball of gutta percha of about 1½ oz. weight has to be driven with implements (clubs) of some variety, devised for the purpose. Their variety is determined by this, that while, in starting from the hole, the ball may be *teed* (i.e., placed where the player chooses, with a little pinch of sand under it called a *tee*), it must in every other case be played strictly from its place as it chances to lie,—in sand, whin, or elsewhere,—a different club being necessary in each particular difficulty. These

clubs may generally be defined as shafts of wood, with so called *heads* of wood or iron attached.<sup>2</sup> Starting from the one hole, it is the immediate aim of the player to drive his ball as far towards the next as he can. Having got within some moderate distance of it, he proceeds to make his "approach shot," carefully selecting the appropriate implement. When he has reached the "putting green,"—a smooth space carefully chosen for the purpose,—he essays to put (or putt) his ball into the hole; and generally, if he does it in two strokes, he may be held skilful or fortunate. The player who holes his ball in the smallest number of strokes is, as matter of course, winner of the hole. The "approach" and the "putting" are by far the most difficult, critical, and important parts of the game; though no one who is not fairly competent in his driving also is ever in the least likely to take rank as a first-class player. The maximum length of a good driving stroke for a first-class player, not favoured by any exceptional circumstances, may perhaps fairly be stated as something over 180 yards, and under 200. For further details as to the mode and order of playing, the reader is referred to the set of "rules" appended to this article.

The game, in description as above, may not seem very lively or entertaining; and it is to be admitted that, seen for the first time, more especially if played by bungling or indifferent performers, it does not look of much promise. No game, however, stirs a keener enthusiasm in its votaries; and very few people who have ever fairly committed themselves to serious practice of it will be found to deny its extreme fascination. It is a manly and eminently healthful recreation, pursued as it is mostly amid the fresh sea-breezes; while, as exercise, it has this peculiar merit, that, according to pace, it may be made easy or smart at pleasure, and thus equally adapts itself to the overflowing exuberance of youth, the matured and tempered strength of manhood, and the gentler decays of age.

It is uncertain at what date golf was introduced into Scotland, but in 1457 the popularity of the game had already become so great as seriously to interfere with the more important pursuit of archery, and cause the rulers of the realm to sound a note of alarm. In March of that year, it is recorded that the Scottish parliament "decreted and ordained that wapinshawings be halden be the lordis and baronis spirituale and temporale, four times in the zeir; and that the fute-ball and golf be utterly cryit down, and nocht usit; and that the bowe-merkis be maid at ilk parochie kirk a pair of buttis, and schuttin be usit ilk Sunday." It does not appear, however, that to this patriotic decree of their parliament the people paid much attention; and fourteen years afterwards, in May 1471, it was judged necessary to pass another Act "anent wapenshawings, and for opposing "our auld enemies of England." But it seems to have been pretty much as before; *schuttin* was no more usit, nor golf the less steadily played because of these decrees of parliament; and accordingly in 1491 a final and evidently angry fulmination is issued on the general subject, with pains and penalties annexed. It runs thus—"Futeball and Golfe forbidden. Item, it is statut and ordainit that in na place of the realme there be usit futeball, golfe, or uther sik unprofitabill sportis, but for the commoun gude of the realme, and defence thereof, that bowis and schuttin be hanted, and bow-markis maid therefor, ordainit in ilk parochin under the pain of fourtie shillings, to be raisit be the schireffe and bailies foresaid." &c. This, be it noted, is an edict of James IV.; and it is not a little curious presently to find the monarch himself breaking his own behest, and setting an ill example to his commons, by practice of this "unprofitabill sport," as is shown by various entries in the accounts of the Lord High Treasurer of Scotland (1503-6).

About a century later, the game again appears on the surface of history, and it is quite as popular as before. In the year 1592, the Town Council of Edinburgh "ordanis proclamation to be maid

<sup>1</sup> From an enactment of James VI. (then James I. of England), bearing date 1618, we find that a considerable importation of golf balls at that time took place from Holland, and as thereby "na small quantitie of gold and silver is transported zierly out of his Hienes' kingdome of Scoteland" (see letter of his Majesty from Salisbury, 5th Aug. 1618), he issues a royal prohibition, at once as a wise economy of the national monies, and a protection to native industry in the article. From this it might almost seem that the game was at that date still known and practised in Holland, though it has long since entirely disappeared there.

<sup>2</sup> A complete set of them may number about a dozen:—a driving club, a long, a middle, and a short "spoon" (so called from the face of the club being spooned, or bevelled, to lift a bad-lying ball), and a "putter" (the use of which is explained below) are the clubs formed wholly of wood, while of iron there are—a heavy and a light "iron," a driving and a lifting "cleek," possibly also a "putting" cleek, finally a "niblick" constructed to pick a ball out of some such hole as no other iron can reach.

threw this bough that, seeing the Sabbath day being the Lord's day, it became every Christian to dedicate himself to the service of God, therefore commanding in our sovereign lord's name, and in name of the provost and burgh, that no inhabitants of the samyn be seen at any pastimes within or without the town, upon the Sabbath day, sic as golfe, &c."<sup>1</sup> The following year the edict was reannounced, but with the modification that the prohibition was 'in time of sermons.'

Golf has from old times been known in Scotland as "The Royal and Ancient Game of Golf." Though no doubt Scottish monarchs handled the club before him, James IV. is the first who figures formally in the golfing record. James V. was also very partial to the game distinctively known as "royal," and there is some scrap of evidence to show that his daughter, the unhappy Mary Stuart, was, in some sort of feminine way, a golfer. It was alleged by her enemies that, as showing her shameless indifference to the fate of her husband, a very few days after his murder, she "was seen playing golf and pallmall in the fields beside Seton."<sup>2</sup> That her son, James VI. (afterwards James I. of England), was a golfer tradition confidently asserts, though the evidence which connects him with the personal practice of the game is slight. Of the interest he took in it we have evidence in his Act—already alluded to—"anent golfe ballis," prohibiting their importation, except under certain restrictions. Charles I. (as his brother Prince Henry had been)<sup>3</sup> was devotedly attached to the game. Whilst engaged in it on the links of Leith, in 1642, the news reached him of the Irish rebellion of that year. He had not the equanimity to finish his match, but returned precipitately and in much agitation to Holyrood.<sup>4</sup> Long afterwards while prisoner to the Scots army at Newcastle, before being given up to the tender mercies of the English Parliament, he found his favourite diversion in "the royal game." "The King was nowhere tierced with more honour than at Newcastle, as he himself confessed, both he and his train having liberty to go abroad and play at golf in the Shield Field, without the walls."<sup>5</sup> Of his son, Charles II., as a golfer, nothing whatever is ascertained, but his brother, James II., was a known devotee.<sup>6</sup> After the Restoration, James, then duke of York, was sent to Edinburgh in 1681-2 as commissioner of the king to parliament, and an historical monument of his prowess as a golfer remains there to this day in the "Golfers' Land," as it is still called, 77 Canongate. The duke having been challenged by two English noblemen of his suite, or *entourage*, to play a match against them, for a very large stake, along with any Scotch ally he might select, judiciously chose as his partner one "Johnie Patisonne," a shoemaker—a local *crack* of the day, it is to be presumed. The duke and the said Johnie won easily, and half of the large stake the duke made over to his humble coudjutor, who therewith built himself the house mentioned above. With the Revolution royal patronage entirely ceased, to be renewed only in comparatively recent times. In 1834 William IV. became patron of the St Andrews Golf Club (St Andrews, the ancient ecclesiastical metropolis of Scotland, being now, as of old, the most famous seat of the game), and to approve of its being styled in time coming "The Royal and Ancient Golf Club of St Andrews." In 1837, as further proof of royal favour, he presented to it a magnificent gold medal, which "should be challenged and played for annually," and in 1838 the queen dowager, duchess of St Andrews, became patroness of the club, and presented to it a handsome gold medal—"The Royal Adelaide,"—as a mark of her approbation, with a request that it should be worn by the captain, as president, on all public occasions. In June 1863 the prince of Wales signified his desire to become patron of the club, and in the following September was elected captain by acclamation. The engagements of the prince did not admit of his coming in person to undertake the duties of the office, but his brother Prince Leopold, having in 1876 done the club the honour to become its captain, twice visited the ancient city in that capacity. Prince Leopold is himself a keen player, and under his superintendence a green has been laid out in Windsor park. The ancient game of golf has thus fairly now again become as "royal" as ever it was in its old historic periods.

The later fortunes of the game have been uneventful. While always keeping its hold on the affections of the people, it might readily be shown, that over Scotland generally its tide, till nearly within our own time, was rather an ebbing than a flowing one. While it remained a favourite pastime with some of the aristocracy and gentry who always had a sufficient following where—as instance, in Edinburgh—the due facilities admitted, the general enthusiasm for the sport which lives for us in the old records had certainly disappeared, and over various isolated greens, where playing was at one time constant, it had virtually and sometimes absolutely died out. Its increased popularity within recent years has no doubt been largely due to those general causes which have led to a keener

interest in almost every form of out door amusement, but it is also in some measure to be attributed to greatly extended railway facilities, and to the introduction some thirty years ago of the cheap and durable gutta percha ball to replace the old missile.

It remains to give some little account of the more noted golf clubs and golfing grounds. The most famous of golf clubs, to which priority is by common consent accorded, is that of the city of St Andrews, instituted in 1754. For various reasons this club has always been of much more than merely local celebrity. Its membership is far more numerous than that of any other, nearly all golfers of note belong to it, and to its spring and autumn meetings they flock from every part of the kingdom. To be winner of a medal at St Andrews is thus the highest honour to which the ambition of the golfer can aspire. A "round," as it is termed, of the links is very nearly four miles, and, extent and quality considered, the green is on the whole unrivalled by any other in Scotland. Of greens in Fife of minor importance those of Link and Leven may be noted. Next in importance to "The Royal and Ancient Golf Club of St Andrews" links "The Honourable the Edinburgh Company of Golfers," who play over Musselburgh green, one of far but scarcely supreme quality. The first of its regular series of minutes bears date 1744, and is signed by Lord President Duncan Forbes of Culloden, but the club itself is beyond question very much older. Of other Edinburgh golf clubs may be noted "The Bruntsfield," founded in the year 1760, and the "Edinburgh Burgess," the minute books of which are preserved since the year 1773, though it claims to have date of origin 1735. In East Lothian, besides the good old green of North Berwick, there are of late years two others,—Gullane and Luffness,—and on all three excellent golfing sport is to be had. At the ancient city of Perth, though the ground is but indifferently adapted for it, the old Scottish game has continuously been maintained, and still flourishes. So also in Forfarshire, at the historic green of Montrose, to which in our own time have been added those of Monifeth and Carnoustie, which, from their proximity to Dundee, naturally attract many players, and all three may be ranked as greens of fair quality. At Aberdeen, till very lately, the game had quite died out, but it has now been with more or less of vigour resumed. At Stirling likewise it was extinct, but is now again fairly alive, though under conditions of ground, as at Perth, not quite satisfactory. At Glasgow also, where on the old "Glasgow Green" the game was habitually played, it had lapsed into disuse and even oblivion, but within the last ten years the general resuscitation has reached it, and a spirited club now exists there. If the ground is by no means what might be wished, the Glasgow golfer, by a very easy railway run, can reach the green of Prestwick, near Ayr. The "Prestwick Club" is, by comparison, of recent origin, having been organized mainly by the last earl of Eglintoun, and one or two gentlemen in the neighbourhood, interested like himself in the game. Except for limitation in extent, making it impossible that a large "field" should be accommodated without confusion and even danger, such is the excellence of the ground that, as a "sporting" green, to test play, that of Prestwick is held by competent judges perhaps to surpass all others. A second links has recently been opened at Prestwick, and another at Troon, on the same coast.

The oldest golf club in the kingdom is not improbably that of Blackheath, near London. The old records of the club were unfortunately destroyed by fire at Greenwich, where they were kept, and 1766 is thus the earliest date for which there is documentary evidence. Tradition places the origin of this club so far back as 1608, when King James, with his Scotch following, brought the game south into England. Recently another London club has been started, whose ground of play is at Wimbledon. Neither green is of great merit, but both are much prized and frequented by golfers in and near London. In 1864, at Biddeford, in Devonshire, a golfing green was laid out by the well known Tom Morris of St Andrews, and a club was duly instituted, which has since continued to flourish. This links is one of the finest and most extensive anywhere to be found, and despite the disadvantage of remoteness and difficulty of access, the meetings of the club attract players from all quarters, and are commonly most successful. More lately an excellent green was opened at Hoylake, near Liverpool, and the club here has also prospered greatly. At Crookham in Berkshire, and Alnwick in Northumberland, the game is regularly played, and at the universities of Oxford and Cambridge rival golf clubs have within the last few years been formed. In brief, the game has now thoroughly taken root in England, from year to year it is rapidly spreading, and many fine English players have already passed into the front rank.

In nearly all the British colonies the game has naturalized itself. Golf clubs of old standing exist at Calcutta and Bombay, and more casually over India a good deal of play is to be met with. Wherever Scots congregate in any numbers a golf club is pretty sure to spring up. In Canada and the United States, as in

<sup>7</sup> The old ball was roughly, a circlet of leather, stitched together in sections, and stuffed as hard as a stone with feathers. It was about twice the price of the present ball, and almost incomparably less durable.

Australia and New Zealand, many clubs may be found flourishing, and, oddly enough, at Pau in the Pyrenees, a golf club has long existed. An export of clubs and balls to all these golfing dependencies has long formed, and still forms, an important item of the manufacture.

We must not quit the subject without making note of one pleasing innovation. Some six or eight years ago, the ladies took to the game, and since have diligently prosecuted it in large numbers, some attaining no mean proficiency. They have hitherto confined themselves to the "short game," as it is termed, or putting, and where a separate piece of ground has been assigned them, as at St Andrews, North Berwick, and elsewhere, the "Ladies' Links" form a pretty and charming adjunct to the main green.

We append the more important rules of the game, as played by "The Royal and Ancient Golf Club of St Andrews," which, though it has no claim to give law to other clubs, may be accepted as, on the whole, the best authority on the subject—

**I Mode and Order of Playing the Game**—The game of golf is played by two persons or by four (two of a side), playing alternately. It may also be played by three or more persons, each playing his own ball. The game commences by each party playing off a ball from a place called the *tee*, near the first hole. In a match of four, those who are opposed to each other, and to play off shall be named at starting, and shall continue so during the match. The person entitled to play off first shall be named by the parties themselves, and although the courtesy of starting is generally granted to old captains of the club, or members, it may be settled by lot or toss of a coin. The hole is won by the party holing it fewest strokes, and the reckoning of the game is made by the terms *odds* and *like one more two more &c*. The party gaining the hole is to lead, unless his opponent has won the previous match, in which case the latter leads off and is entitled to claim his privilege, and to recall his opponent's stroke should he play out of order. One round of the links, or 18 holes, is reckoned a match, unless otherwise stipulated. If, in a double match, one person shall play twice in succession, he loses the hole.

**II Place of Teeing**—The ball must be teed not nearer the hole than eight, nor further than twelve club lengths, except where special ground has been marked by the conservator of the links, which shall be considered the "teeing ground," and the balls shall be teed within and not in advance of such marks. After the balls are struck off, the ball furthest from the hole to which the parties are playing must be played first. When two parties meet on the putting green, the party first there may claim the privilege of holing out, and any party coming up must wait till the other party has played out the hole, and on no account play their balls up lest they should annoy the parties who are putting. No player may play his teed ball till the party in front has played their second strokes.

**III Changing the Balls**—The balls struck off from the tee must not be changed, touched, or moved before the hole is played out (except in striking, and the cases provided for by Rules VIII, XVIII, and XIX), and if the parties are at a loss to know the one ball from the other, neither shall be lifted till both parties agree.

**IV Lifting of Branch Clubs &c**—All loose impediments within a club length of the ball may be removed on or off the course, when the ball lies on grass (see Rules VI and XII). When a ball lies in a bunker, sand, or any other hazard, there shall be no impression made nor sand or other obstacle removed by the club, or otherwise, either on or off the green, before striking at the ball. When a ball lies within a club length of a washing tub, the tub may be removed, and when on clothes the ball may be lifted and dropped behind them.

**V Entitled to see the Ball**—When a ball is completely covered with fog, bent, whins, &c., so much thereof shall be set aside as that the player shall merely have a view of his ball before he plays, whether in a line with the hole or otherwise. A ball stuck fast in wet ground or sand may be taken out and replaced loosely in the hole it has made.

**VI Clearing the Putting Green**—All loose impediments, of whatever kind, may be lifted on the putting green or table land on which the hole is placed (excepting as declared in Rule IV), which is considered not to exceed twenty yards from the hole. Nothing can be lifted either on the course or putting green, if it is to move the ball out of its position.

**VII Lifting Balls**—When, on any part of the course, or off it, or in a bunker, the balls lie within six inches of each other, the ball nearest the hole must be lifted till the other is played, and then placed as nearly as possible in its original position—the six inches to be measured from the surface of the balls. In a three ball match, the ball in any degree interposing between the player and the hole on the putting green, must be played out.

**VIII Ball in Water, or in the Burn and Place of Reteeing**—If the ball is in water, the player may take it out, change the ball if he pleases, tee it, and play from behind the hazard, losing a stroke. If the ball lies in any position in the burn across the first

hole, the player may take it out, tee it on the line where it entered the burn, on the opposite side from the hole to which he is playing, and lose a stroke, or he may play it where it lies without a penalty. However, should a ball be driven into the Eden at the high hole or the sea at the first hole, the ball must be placed a club length in front of either sea or river the player or party losing a stroke. In playing for a medal, a ball driven into the Eden may be treated as a lost ball.

**IX Rubs of the Green**—Whatever happens to a ball by accident, such as striking any person, or being touched with the foot by a third party, or by the fore caddy, must be reckoned a rub of the green, and submitted to. If, however, the player's ball strike his opponent, or his opponent's caddy or clubs, the opponent loses the hole, or if he strikes himself or his partner, or their caddies or clubs, or if he strikes the ball a second time while in the act of playing, the player loses the hole. If the player touch the ball with his foot, or any part of his body, or with anything except his club, or if he with his club displace the ball in preparing to strike, he loses a stroke, and if one party strikes his opponent's ball with his club, foot, or otherwise, that party loses the hole. But if he plays it inadvertently, thinking it his own, and the opponent also plays the wrong ball, it is then too late to claim the penalty, and the hole must be played out with the balls thus changed. If, however, the mistake occurs from wrong information given by one party to the other, the penalty cannot be claimed, and the mistake, if discovered before the other party has played, must be rectified by replacing the ball as nearly as possible where it lay. If the player's ball be played away by mistake, or lifted by a third party, then the player must drop a ball as near the spot as possible, without any penalty. Whatever happens to a ball on a medal day, such as a player striking his caddy, or himself, or his clubs, or moving the ball with his foot or club, or his caddy doing so, or the player striking it twice before it stops motion, the player in such cases shall lose one stroke only as the penalty.

**X Ball Lost**—If a ball is lost, the player (or his partner, in a double match) returns to the spot, as near as possible where the ball was struck, tees another ball, and loses both the distance and a stroke. If the original ball is found before the party has struck the other ball, the first shall continue the one to be played.

**XI Club Breaking**—If, in striking the club breaks, it is nevertheless counted to be a stroke, if the part of the club remaining in the player's hand either strike the ground or pass the ball.

**XII Holing out the Ball**—In holing no mark shall be placed, or line drawn, to direct the ball to the hole, the ball must be played fairly and honestly for the hole, and not on your opponent's ball not being in the way to the hole, nor although lying in the way to the hole is the player entitled to play with any strength upon it that might injure his opponent's position, or greater than is necessary honestly to send your own ball the distance of the hole. Either party may smooth sand lying around the hole, but this must be done lightly and without pressure, or beating down with the feet, club or otherwise. If, in holing out, the ball rests upon the flag stick in the hole, the player shall be entitled to have the stick removed, and if the ball falls in, it shall be considered as holed out, but either party is entitled to have the flag stick removed when approaching the hole.

**XIII Unplaying Balls**—In Match playing every ball must be played, wherever it lies, or the hole be given up, excepting when it lies on clothes, in water, or in the bed of the burn (see Rules IV and VIII), or in any of the holes, or short holes, made for golfing, in which latter case it may be lifted, dropped behind the hazard, and played without losing a stroke. In Medal playing a ball may, under a penalty of two strokes, be lifted out of a difficulty of any description and teed behind the hazard, and if in any of the golfing holes, it may be lifted, dropped and played without a penalty. In all cases where a ball is to be dropped the party doing so shall front the hole to which he is playing, standing close on the hazard, and drop the ball behind him from his head.

**XV Asking Advice**—A player must not ask advice about the game, by word, look, or gesture, from any one except his own caddy, his partner's caddy, or his partner.

**XVIII Balls Splitting**—If a ball shall split into two or more pieces, a fresh ball shall be put down where the largest portion of the ball lies, and if a ball is cracked the player may change it on intimating his intention of doing so to his opponent.

**XIX Breach of Rules**—Where no penalty for the infingement of a rule is specially mentioned, the loss of the hole shall be understood to be the penalty.

Golf which, as we have seen, has a history of some interest, has also a literature (copious in verse and prose), and a somewhat amusing anecdotalog. In *Golf, a Royal and Ancient Game*, a work issued in 1875 by Mr Robert Clark of Edinburgh, a well known and accomplished adept, a very careful collection will be found of every thing connected with the game which in this form deserves preservation. Through the ready kindness of the author this admirable compendium has been available, and free use has been made of it, in the preparation of this article. (P P A)

**GOLIUS** or **GOËL**, **JACOBUS** (1596–1667), a Dutch Orientalist, was born at the Hague in 1596, and studied at the University of Leyden, where in Arabic and other Eastern languages he was the most distinguished pupil of Erpenius. In 1622 he accompanied the Dutch embassy to Morocco, and on his return he was chosen to succeed Erpenius (1624). In the following year he set out on a Syrian and Arabian tour from which he did not return until 1629. The remainder of his life was spent at Leyden where from that date he held the chair of mathematics as well as that of Arabic until his death, which occurred on September 28th, 1667.

His most important work is the *Lexicon Arabico-Latinum*, fol., Leyden 1653, which, based on the *Sihah* of Al-Jauhari, has only recently been superseded by the corresponding work of Freytag. Among his earlier publications may be mentioned editions of various Arabic texts (*Proverbia quaedam Alis, imperatoris Muslemici, et Carmen Tograi, poetæ doctissimi, necnon dissertatio quædam Aben Synæ*, 1629; and *Ahmedis Arabsiadæ vitæ et rerum gestarum Timuri, qui vulgo Tamerlanes dicitur, historia*, 1636). In 1656 he published a new edition, with considerable additions, of the *Grammatica Arabica* of Erpenius. After his death, there was found among his papers a *Dictionary Persico-Latinum* which was published, with additions, by Edmund Castell in his *Lexicon Heptaglotton* (1669). Golius also edited, translated, and annotated the astronomical treatise of Alfragan (*Muhammedis, filii Ketiri Ferganensis, qui vulgo Alfraganus dicitur, Elementa Astronomica Arabice et Latine*, 1669).

**GOLLNOW**, a town in the Prussian province of Pomerania, government district of Stettin, is situated on the right bank of the Ilva, 14 miles N.N.E. of Stettin, with which it has communication by steamer. It possesses two suburbs, and has manufactures of linen and woollen goods, copper wares, ribbons, paper, and tobacco. Gollnow was founded in 1190, was raised to the rank of a town by Barnim I. in 1268, and in 1314 received Lübeck rights. It was formerly a Hanse town, and came into the possession of Prussia in 1720. The population in 1876 was 7913.

**GÖLNITZ**, or **GÖLLNITZ** (**GOLNICZBÁNYA**), a mining town of Hungary, on a river of the same name, in the county of Szepes (Zips), about 18 miles south-west of Eperies, 48° 51' N. lat., 20° 59' E. long. In the vicinity are iron and copper mines, which, with the forges, and the nail and wire factories, &c., afford employment to most of the inhabitants. It is the seat of a mining council and tribunal, has Roman Catholic and Protestant churches, post and telegraph offices, and a high school. In 1870 the population amounted to 5205, composed of Magyars, Slavs, and Germans. Gölnitz was formerly a royal free town; its chief importance now is as a mining centre.

**GOLOVNIN**, **VASILY MIKHAILOVICH** (1776–1831), a Russian vice-admiral, was born April 20, 1776, in the village of Gulyuki, in the province of Ryazan, and received his education at the Cronstadt naval school. From 1801 to 1806 he served as a volunteer in the English navy. In 1807 he was commissioned by the Russian Government to survey the coasts of Kamchatka and of Russian America, including also the Kurile Islands. Golovnin sailed round the Cape of Good Hope, and on October 5, 1809, arrived in Kamchatka. In 1810, whilst attempting to survey the coast of the island of Kunashir, he was seized by the Japanese, and was retained by them as a prisoner until October 13, 1813, when he was liberated, and in the following year he returned to St Petersburg. Soon after this the Government planned another expedition, which had for its object the circumnavigation of the globe by a Russian ship, and Golovnin was appointed to the command. He started from St Petersburg on the 7th September 1817, sailed round Cape Horn, and arrived in Kamchatka in the following May. He returned to Europe by way of the Cape of Good Hope, and landed at St Petersburg, September 17, 1819. He died July 12, 1831.

Golovnin published several works, of which the following are the most important:—*Journey to Kamchatka*, 2 vols., 1819; *Journey round the World*, 2 vols., 1822; and *Narrative of my Captivity in Japan*, 2 vols., 1816. The last has been translated into French, German, and English. A complete edition of his works was published at St Petersburg, 1864, in five volumes, with maps and charts, and a biography of the author by N. Grech.

**GOLTZ**, **BOGUMIL** (1801–1870), humorist and satirist, was born of a German family settled at Warsaw, March 20, 1801. At the age of seven he was taken by some friends to Königsberg, and after studying at the gymnasium was placed under the care of a country clergyman near Marienwerder. He next went to the gymnasium of Marienwerder, and finally returned to Königsberg. In 1817 he began to learn practical farming on an estate near Thorn; but the strong desire which he felt for scientific culture led him, five years later, to the university of Breslau. There he at first entered upon the study of theology, but he did not pursue it, selecting instead philosophy and philology. The next year he bought an estate near Thorn, married the daughter of a Prussian officer, and applied himself to the duties of a farmer. He did not succeed; and after other equally unsuccessful experiments in the same line in Poland and Prussia, he retired in 1830 to the small town of Gollub, and devoted himself to literary studies. Sixteen years of meditative seclusion passed away; and then, having taken up his abode at Thorn, he gave to the world the first fruits of his studies and reflexions in the charming poetic *Buch der Kindheit* (1847), in which he delineates the incidents and impressions of his own childhood with a tender feeling like that of Jean Paul. The dates which he gives in this narrative are inconsistent with those which he furnished for the memoir in Brockhaus's *Conversations-Lexikon*; and a chronological difficulty is thus created which perhaps it may not be possible to solve.

The *Buch der Kindheit* was speedily followed by a satirical and polemical epistle against Ronge and the friends of enlightenment, which he entitled *Deutsche Entartung in der lichtfreundlichen und modernen Lebensart*. For the purpose of enlarging his experience of men, and of amassing stores of material for his art as humorist and reformer of human life and society, he undertook a course of extensive travels, visiting Germany, France, England, Italy, and Egypt. In 1850 he published *Das Menschendaseyn in seinen weltweiten Zügen und Zeichen*. This was followed by another poetically conceived work on his own early life, entitled *Ein Jugendleben: Biographisches Idyll aus Westpreussen* (1852), and by *Ein Kleinstädter in Aegypten* (1853). In his next work, *Der Mensch und die Leute* (1858), he especially displays his peculiar powers in profound and acute sketches of various races of men. It is a book of enduring value. His *Die Deutschen*, consisting of a series of studies on the history and peculiarities of the genius of the Germans, appeared in 1860. His other works are *Zur charakteristik und Naturgeschichte der Frauen* (1859), *Typen der Gesellschaft* (1860), *Die Bildung und die Gebildeten* (1864), *Vorlesungen* (1869), and *Die Weltklugheit und die Lebensweisheit mit ihren correspondirenden Studien* (1869). Goltz is a follower of Jean Paul, and has many of the characteristics of his master; but he takes a lower place as literary artist, wanting Jean Paul's creative imagination. He died at Thorn, November 11, 1870.

An interesting essay on Goltz was contributed by the poet, Rudolf Gottschall, to *Unsere Zeit*, new series, 1871.

**GOLTZIUS**, **HENDRIK** (1558–1617), a Dutch painter and engraver, was born in 1558 at Mulebrecht, in the duchy of Juliers. After studying painting on glass for some years under his father, he was taught the use of the burin by Dirk Volkertsz Coornlert, a Dutch engraver of mediocre attainment, whom he soon surpassed, but who retained his services for his own advantage. He was also employed by Philip

Galle to engrave a set of prints of the history of Lucretia. At the age of twenty-one he married a widow somewhat advanced in years, whose money enabled him to establish at Haarlem an independent business; but his unpleasant relations with her so affected his health that he found it advisable in 1590 to make a tour through Germany to Italy, where he acquired an intense admiration for the works of Michelangelo, which led him to surpass that master in the grotesqueness and extravagance of his designs. He returned to Haarlem considerably improved in health, and laboured there at his art till his death, January 1, 1617. Goltzius ought not to be judged chiefly by the works he valued most, his eccentric imitations of Michelangelo. His portraits, though mostly miniatures, are master-pieces of their kind, both on account of their exquisite finish, and as fine studies of individual character. Of his larger heads, the life-size portrait of himself is probably the most striking example. His "master-pieces," so called from their being attempts to imitate the style of the old masters, have perhaps been overpraised. In his command of the burin Goltzius is not surpassed even by Dürer; but his technical skill is often unequally aided by higher artistic qualities. Even, however, his eccentricities and extravagances are greatly counterbalanced by the beauty and freedom of his execution. He began painting at the age of forty-two, but none of his works in this branch of art—some of which are in the imperial collection at Vienna—display any special excellences. He also executed a few pieces in chiaroscuro. His prints amount to more than 300 plates, and are fully described in Bartsch's *Peintre-graveur*, and Weigel's supplement to the same work.

GOMARUS, FRANCIS (1563–1641), professor of theology at Leyden, was born at Bruges on the 30th January 1563. His parents, having embraced the principles of the Reformation, emigrated to the Palatinate in 1578, in order to enjoy freedom to profess their new faith, and they sent their son to be educated at Strasburg under John Sturm. He remained there three years and then went to Neustadt, whither the professors of Heidelberg had been driven by the elector-palatine because they were not Lutherans. He did not stay long at Neustadt, but crossed to England towards the end of the year 1582, and entered first the university of Oxford, where he attended the lectures of John Raynold, and then the university of Cambridge, where he attended those of William Whitaker. At Cambridge he received his bachelor's degree in June 1584, and thence proceeded to Heidelberg, where the faculty had been by this time re-established, and continued his studies there for two years more. He was called to be minister of a Reformed church in Frankfurt in 1587, and laboured there till the congregation was dispersed by the persecution of the year 1593. In 1594 he was appointed professor of theology at Leyden, and before going thither received from the university of Heidelberg the degree of doctor. He taught quietly at Leyden till 1603, when Arminius came to be one of his colleagues in the theological faculty, and began to teach Pelagian doctrines and to create a new party in the university. Gomarus immediately set himself earnestly to oppose these views, in his classes at college, and wherever he found opportunity. He became the leader of the opponents of Arminius, who from that circumstance came to be known as Gomarists. He engaged twice in personal disputation with Arminius in the assembly of the estates of Holland in 1608, and was one of five Gomarists who met five Arminians or Remonstrants in the same assembly in the following year. On the death of Arminius shortly after this time, Vorstius, who sympathized with his views, was appointed to succeed him, in spite of the keen opposition of Gomarus and his friends; and Gomarus took his defeat so ill that, rather than have such a man for his

colleague, he resigned his post, and went to Middleburg in 1611, where he became minister of a congregation and gave public lectures. From this place he was called to a chair of theology at Saumur, where he remained four years, and then accepted a call as professor of theology and Hebrew to Gröningen, where he stayed till his death on 11th January 1641. He took a leading part in the synod of Dort, assembled in 1618 to judge of the doctrines of Arminius. He was a man of ability, enthusiasm, and learning, a considerable Oriental scholar, and also a keen controversialist. He took part in the translation of the Old Testament into Dutch in 1633, and after his death a book by him called the *Lyra Davidis* was published, which sought to explain the principles of Hebrew metre, and which created some controversy at the time, having been opposed by Louis Capel. His works were collected and published in one volume folio, in Amsterdam in 1645.

GOMBROON, another name for BENDER-ABBASI (*q.v.*).

GOMER, the eldest son of Japhet (Gen. x. 2), and an ally of Gog (Ezek. xxxviii. 6), has usually, since Calmet's time, been identified with those Cimmerii who, originally inhabiting the districts to the N.E. and N. of the Black Sea and Sea of Azoff, at an early period began to penetrate as far as to Asia Minor, and in the 7th century B.C. overran Lydia, though without leaving permanent traces of their presence. This identification, however, is to be met with in none of the older writers. Josephus understands the Galatians of northern Phrygia to be intended; and Gimmeri or Gamir was, in the language of the ancient Armenians, a usual designation for their neighbours the Cappadocians (see Dillmann on Gen. x. 2; whose authority is Kephallion, in the Armenian version of the *Chronica* of Eusebius, ed. Aucher). It is not impossible that an intimate ethnological connexion between the Cappadocians of Kephallion and the Cimmerians of Homer may ultimately be established; but meanwhile it is important to observe that the three sons of Gomer, as named in Gen. x. 2, admit of a tolerably definite localization. Ashkenaz, who has sometimes been identified with the Germans, is almost certainly the same as the Ascanians, a very ancient tribe of northern Phrygia (*cf.* Strabo, xii. 4, 5, *sqq.*, and note the juxtaposition in Jer. li. 27). Riphath has nothing to do with the Rhipæan mountains, with the Carpathians, or with Niphates, but, as Josephus has pointed out, is to be identified with Paphlagonia; as Bochart has shown, the name probably survives in *Ῥίβας*, the designation of a river in Bithynia, and in *Ῥιβάρια*, a district situated on the Thracian Bosphorus. Although Togarmah is by Josephus interpreted as equivalent to Phrygia, there is a considerable amount of ancient testimony in favour of its identification with Armenia. It is possible that the same root is actually at the basis of the two words; at all events the connexion is assumed in the account which the Armenians themselves give of their legendary history.

GONDA, a district of Oudh, lying between 26° 46' and 27° 50' N. lat., and between 81° 35' and 82° 48' E. long., bounded on the N. by the lower range of the Himalayas, on the E. by Basti district, on the S. by Fyzabad and Bara Banki, and on the W. by Bharaich, and having an area of 2824 square miles.

Gonda presents the aspect of a vast plain with very slight undulations, studded with groves of mango trees. The surface consists of a rich alluvial deposit which is naturally divided into three great belts known as the *tarái* or swampy tract, the *uparhár* or uplands, and the *tarhár* or wet lowlands, all three being marvellously fertile. Several rivers flow through the district, but only two, the Gogra and Rápti, are of any commercial importance, the first being navigable throughout the year, and the latter during the rainy season. The country is dotted over with small lakes,

the water of which is largely used for irrigation. The *feræ naturæ* consist of tigers, leopards, bears, wolves, and deer. Large game birds are plentiful.

This district has no particular history of its own; what ancient history it has is included in that of Oudh. On the outbreak of the mutiny, the *rājā* of Gonda, after honourably escorting the Government treasure to Fyzabad, joined the rebels. His estates, along with those of the *rānī* of Tulsipur, were confiscated, and conferred as rewards upon the *mahārājās* of Balrampur and Shāhganj, who had remained loyal. The census of 1869 disclosed a population of 1,166,515 (602,862 males, and 563,653 females)—Hindus, 1,049,897; Mahometans, 117,070; Christians—European, Eurasian, and native—48. Five towns contain a population exceeding 5000, namely, Gonda, Balrampur, Colonelganj, Nawabganj, and Utraula. Rice, wheat, and barley are the chief products of the district. The area under cultivation is 998,858 acres. The exports are rice and food grains; the imports, cotton, European piece goods, and salt. The administration is under a deputy commissioner, aided by two European assistants. The total revenue (1875-76) amounted to £135,509; the expenditure to £15,810. The police force (1873) consisted of 484 officers and men, maintained at a cost of £6655. Education is still in its infancy. In 1875-76 there were 116 schools under Government inspection, attended by 5879 pupils. Fever is prevalent throughout the district. The other principal diseases are scurvy, cholera, diarrhoea, and goitre. The average rainfall during the eleven years 1865-1875 was 42.0 inches. The average yearly temperature is 77.5° Fahr., the highest recorded being 106°, the lowest 48°.

GONDA, the chief town and administrative headquarters of Gonda district, in 27° 8' N. lat. and 82° 1' E. long. The site on which the town now stands was originally a jungle, in the centre of which was a cattle fold (Gontha or Gothán), in which the cattle were enclosed at night as a protection against wild beasts, and from this the town derived its name. The place was formerly celebrated for the manufacture of shields; now it is neither of commercial nor of religious importance. The town contains a civil station, dispensary, school, literary institute, court-house, and jail. Population, 13,722.

GONDAR, properly GUENDAR, a town of Abyssinia, formerly the capital of the Amharic kingdom, is situated on a basaltic ridge in the country of Dembea, about 21 miles N.E. of Lake Tsana or Tana, a splendid view of which is obtained from the castle. According to Rüppell, its latitude is 12° 35' N. and its longitude 37° 31' 57" E., and it lies 7460 feet above the level of the sea. Two streams, the Angreb on the east side and the Gaha or Kaha on the west, flow down from the ridge, and meeting below the town pass onwards to the lake. In the Gaha the Christian inhabitants of Gondar are accustomed to bathe in vast disorderly crowds on the feast of St John the Baptist (10th September), and again in a more decent manner on the anniversary of the Saviour's birth. The town is divided into several districts separated from each other by wood and field,—one being the Abun-Bed or bishop's quarter, another the Etchege-Bed or quarter of the prior or chief of the monks, while a third takes its name from the Debra Birhan or Church of the Light, and a fourth from the Gemp or castle. This was at one time a splendid pile, designed on the plan of a mediæval stronghold; and the solidity of its masonry, the beauty of its ornamentations, and the general effect of its arrangement stand in striking contrast to the mean and monotonous houses of the town, which are all erected after the cylindro-conical type. It was built in the 16th century for King Socinius by the Portuguese adventurers, who employed Indian workmen in its erection. At some distance there is another palace built at a later date for Ras Michael, which affords no bad imitation of the Portuguese style. Upwards of forty churches, all in the circular Abyssinian style, are said to exist in the town and immediate vicinity; of these the most important is the Quisquam or Flight into Egypt, erected by Mintwab Muntwar, the empress mother of Yasu the Great

and Yasu the Little. The painting of the interior was probably executed by the Venetian artists mentioned by Bruce. The city was founded in the 15th century by emperor Fasilidas, or A'lem-Seged; it has been frequently sacked, and in 1868 it was laid in ruins by Theodorus, who did not spare either the castle or the churches. The population, estimated by Bruce at 10,000 families, has been brought to a very low ebb by the political distractions of the country. In 1853 Heuglin thought the inhabitants might number from 5000 to 6000, and in 1861-62 he raised the figure to from 6000 to 7000. About 2000 of the number are Mahometans, and there is a considerable settlement of Jews (Falasha). Cotton cloth, gold and silver ornaments, copper wares, fancy articles in bone and ivory, excellent saddles, and shoes are among the products of the local industry. The shoes are made almost exclusively for the clergy, as the ordinary Abyssinians either go barefoot or wear sandals. See especially Rüppell, *Reise in Abyssinien*, Frankfort-on-the-Main, 1838-40; Heuglin, *Reise nach Abessinien*, Jena, 1868; Lejean, *Voyage en Abyssinie*, Paris, 1872; and Raffray, *Afrique Occidentale*, Paris, 1876. Views of the castle are given by Heuglin and Raffray.

GONDOKORO. See ISMAILIA.

GONDWANA, a tract of country in Central India, extending from the 19th to the 25th degree of N. lat., deriving its name from the aboriginal tribe of *Gonds*, who form the predominant element in the population. The tract may be considered as comprising part of the British territory of Sāgor and Nerbudda, with the districts of Singrauli, Chotā Nāgpur, and Sirguja, the petty native states on the S.W. frontier of Bengal, the Cuttack Mahals, and the northern portion of Nāgpur. It is estimated to be 400 miles in length by 280 in average breadth. Gondwana, in its most extensive sense, includes all that part of India within the above-mentioned boundaries which remained unconquered by the Mahometans up to the reign of Aurungzebe. But Gondwana proper is limited to four districts, named Māndla, Chhatisgarh, Nāgpur, and Chāndal, and it stretches south along the east side of the Wardha and Godāvari, to within 100 miles of the mouth of the latter. The greater part of this province is a mountainous, unhealthy, and ill-watered country, covered with jungle, and thinly inhabited; and to its poverty and other bad qualities its independence may be ascribed. A continued chain of moderately elevated hills extends from the southern frontier of Bengal almost to the Godāvari, and by these the eastern was formerly separated from the western portion of the Nāgpur dominions. This province contains the sources of the Nerbudda and the Son, and is bounded by the Wardha and Godāvari; but a want of water is still the general defect, the streams by which it is intersected, namely, the Mahānadi, Kārun, Hatus, and Silāir, being inconsiderable, and not navigable within its limits. The Gonds, or the hill tribes who took refuge in the mountains and fastnesses from the invaders of the country, are the original inhabitants of the country, and, till recently, retained all their primeval habits of barbarism. They have now adopted a form of Hinduism, but they retain many of their ancient customs, and abstain from no flesh except that of the ox, cow, and bull. According to the census of 1872 they numbered 2,041,276, or nearly 25 per cent. of the entire population of the Central Provinces. The more fertile tracts of Gondwana were subdued at an early period by the Marhattās, who claimed as paramount over the whole. The inhabitants were rendered nominally tributary; but it was found impossible to collect any revenue from them without military force, so that, in fact, the collection of the revenue was like a plundering expedition, the cost of which always exceeded the profit.

During the war against the Pindáris in 1818, when the British troops invaded the territories of Appa Sâhib, the rájá of Nágpur, their operations were greatly facilitated by the insurrection of the hill tribes, who occupied the passes into the Nágpur territories. For a long series of years it was the policy of the rájá of this territory, a descendant of Sivají, to interfere as little as possible with the neighbouring powers. At length, in 1803, Raghojî Bhonslá was induced, in an evil hour for himself, to depart from this system of neutrality, and to join Sindhia in a confederacy against the British. He was soon reduced, however, by the defeats which the confederates sustained at Assaye and Argaum, to sue for peace, as the price of which he ceded a large portion of his dominions to the conquerors, namely, the province of Orissa. After the death of this rájá, the throne, contested by various competitors, was at last secured by Appa Sâhib, his nephew, who, in the war against the Pindáris, joined the coalition against the British power, and was involved in ruin along with his other allies. A treaty of peace was concluded with him, which he violated; and he was finally deposed in 1818, and the grandson of the late rájá put in his stead. The latter prince, after a reign of 35 years, died without issue in 1853; the dynasty thus became extinct, and the kingdom of Nágpur was incorporated with the British empire, and now forms the chief commissionership of the Central Provinces.

GONG (Chinese, *gong-gong* or *tam-tam*), a sonorous or musical instrument of Chinese origin and manufacture, made in the form of a broad thin disc with a deep rim. Gongs vary in diameter from about 20 to 40 inches, and they are made of bronze containing a maximum of 22 parts of tin to 78 of copper; but in many cases the proportion of tin is considerably less. Such an alloy, when cast and allowed to cool slowly, is excessively brittle, but it can be tempered and annealed in a peculiar manner. If suddenly cooled from a cherry-red heat, the alloy becomes so soft that it can be hammered and worked on the lathe, and afterwards it may be hardened by re-heating and cooling it slowly. In these properties, it will be observed, the alloy behaves in a manner exactly opposite to steel, and the Chinese avail themselves of the known peculiarities for preparing the thin sheets of which gongs are made. They cool their castings of bronze in water, and after hammering out the alloy in the soft state, the finished gongs are hardened by heating them to a cherry red, and allowing them to cool slowly. The gong is beaten with a round, hard, leather-covered pad, fitted on a short stick or handle. It emits a peculiarly sonorous sound, its complex vibrations bursting into a wave-like succession of tones, sometimes shrill, sometimes deep. In China and Japan it is used in religious ceremonies, state processions, marriages, and other festivals; and it is said that the Chinese can modify its tone variously by particular ways of striking the disc. Among Western communities it is only employed as a substitute for a dinner bell or a general household signal.

GÓNGORA Y ARGOTE, LUIS DE (1561-1627), Spanish lyric poet, was born at Cordova, on the 11th of July 1561. His father, Don Francisco de Argote, was corregidor of that city; and his mother, Doña Leonora de Góngora, was descended from an ancient and noble family of Navarre. Having been sent, at the age of fifteen, as a student of civil and canon law to the university of Salamanca, he soon took a prominent place among his fellow-students; but the great talent which he exhibited did not point in the direction either of legal or of diplomatic employments. Leaving the university some years afterwards (the exact date is unknown) without a degree, but already with a considerable literary reputation, he returned to Cordova, where he had succeeded to a moderate property, and where he was able to associate on terms of intimacy and equality with the best society of the city and province. Lope de Vega, writing about 1593, speaks of him as surrounded there by a literary society, and acknowledged as its chief. In 1604, when past his fortieth year, he took the tonsure, and accepted a prebendal stall in the cathedral of Cordova,—steps which have usually been attributed to worldly or sordid motives, but which really cannot be re-

garded as unnatural or unbecoming in a man circumstanced as he was. From this time he began to spend a portion of each year at the seat of the court, first at Valladolid and afterwards at Madrid, where as Pellicer, his contemporary, remarks, he “noted everything and pecked at everything with his satirical pen.” His circle of literary and other distinguished admirers was now greatly enlarged; but the acknowledgment which the court accorded to his singular genius was both slight and tardy. Ultimately indeed, through the influence of the duke of Lerma and the marquis of Siete Iglesias, he obtained an appointment as honorary chaplain to Philip III., but even this slight honour he was not permitted long to wear. A severe illness, which had seriously impaired his memory, compelled his retirement to Cordova, where, after a period of deep seclusion, he peacefully breathed his last on the 23d of May 1627. An edition of his poems was published almost immediately after his death by Juan Lopez de Vicuña; but the frequently reprinted edition by Hozes did not appear till 1633. The collection consists of numerous sonnets, heroic, amorous, satirical, humorous, elegiac, and “miscellaneous,” of various odes, ballads, songs for the guitar, of a few uncompleted comedies, and of certain larger poems, such as the *Soledades* (“Solitary Musings”) and the *Polifemo*, which hardly admit of classification. They all exhibit that learned and polished elaboration of style (*estilo culto*) with which the name of Góngora is inseparably associated; but if, since the days of Lope de Vega, they have been justly censured for their affected Latinisms, unnatural transpositions, strained metaphors, and frequent obscurity, it must never be forgotten that their author was a man of genius,—a fact cordially acknowledged by those of his contemporaries who were most capable of judging, and indeed a fact capable of direct verification by any one who chooses to take the trouble of reading him even in an imperfect translation. It was only in the hands of those who served themselves heirs to Góngora’s style, without inheriting his genius, that “cultismo” became really laughable; but it is manifestly unjust to charge the memory of the master with the follies of his weaker disciples.

A series of *Lecciones Solemnnes*, or expository lectures on the *Polifemo*, *Soledades*, *Pamagórico*, and *Piramo y Tisbe* was published by Pellicer in 1630; an *Illustracion y Defensa de la Fábula de Piramo y Tisbe*, by Salazar Maldones, followed in 1636; there is also a commentary on the entire works by Salcedo Coronel (1636-48). A good edition of the works of the “Andalucian Pindar” (as Góngora is designated by Pellicer) is that of Brussels (1659). The admirable labours of Churton (*Gongora, an Historical and Critical Essay on the Times of Philip III. and IV. of Spain, with Translations*, 1862) have made this obscure author easily accessible to the English reader.

GONIOMETER. Strictly speaking this name is applicable to any instrument, such as a mural circle, a theodolite, and so on, used for measuring an angle; it is in reality, however, applied exclusively to instruments used for measuring the angles between the faces of crystals. The oldest instrument of the kind was invented by Carangeot, and consisted simply of a pair of rulers jointed together and fitted with a graduated circle for measuring the angle between their edges. A carpenter uses a somewhat similar instrument, not, it is true, for measuring, but for transferring angles. The application of the principle of reflexion by Wollaston in 1809 converted the goniometer into an instrument of precision. His form, with a vertical divided circle, is still much used. The principle of reflexion is briefly this. The crystal is mounted so that it can be rotated about an axis parallel to the edge in which its two faces meet. It is first placed so that a ray of light coming in some fixed direction (say, along the axis of a collimator), when reflected from one face, passes in another fixed direction (say, along the axis of a telescope). The crystal is then turned till the ray reflected from the other face passes

in the same direction as before. The angle through which the crystal has been turned is either  $180^\circ + 2A$  or  $180^\circ - 2A$ , where  $A$  is the angle between the faces. The introduction of the fixed mirror by Degen and Lang, and of the horizontal circle with collimators, brought the instrument into its most modern form. Babinet, Malus, Mitscherlich, Haidinger, Von Lang, and others have contributed towards perfecting the instrument. Recently Professor W. H. Miller (*Phil. Mag.*, 1876) has described a new form of goniometer. In the paper quoted some useful details concerning the use of the instrument will be found. For further instructions how to use the goniometer the reader may refer to Phillips's *Mineralogy*, or Groth's *Physikalische Krystallographie*, Abth. iii. The modern goniometer has so much in common with the spectrometer that it is unnecessary to describe it in detail here. See SPECTROSCOPE.

GONSALVO. See GONZALO.

GONZAGA, or GONZUGUE, an old princely family of Italy, which traces its origin to the emperor Lothair, but first came into notice in the 11th century, after the overthrow of the imperial power in Italy, where they for some time disputed the sovereignty of Mantua with the Bonacosse. The long dispute was ended by the murder of Passerino de Bonacossi in 1328, after which the Gonzaga retained possession of Mantua for four centuries. Their claims were in 1354 confirmed to Ludovico I. (1267–1360) by Louis the Bavarian, who nominated him imperial vicar, and gave him also the sovereignty of Reggio and other towns. Petrino, youngest son of Ludovico, founded the countship of Novellara, which became extinct in 1728. The elder branch of the family was continued by Guido and his son Ludovico II., who, on his death in 1382, was succeeded by his brother Francesco. He was followed in 1407 by his son Giovanni Francesco (1394–1444), on whom, for his services in the Italian wars, the emperor Sigismund in 1433 bestowed the title of marquis. Ludovico III. (1414–1478), son of the preceding, surnamed, for what reason is not quite certain, the Turk, retained a body of troops which he granted on hire to neighbouring princes. The younger sons of this Ludovico, Giovanni Francesco and Rudolpho, founded the dukedoms of Gabioneta and Castiglione respectively, which were confiscated in 1692. The elder branch of the family was continued by Frederick I. (1439–1484), whose son, Giovanni Francesco II. (1466–1519), was in 1494 appointed to the supreme command of the united Italian army against Charles VIII. of France, and on the 6th of July of the following year gained the victory of Fornovo, and took prisoner the bastard of Bourbon. His son, Frederick II. (1500–1540), received in 1530 the title of duke from Charles V., and in 1536 the principality of Montferrat. A younger son, Ferdinand, was the founder of the Guastella branch of the family, which became extinct in 1746. Of the succeeding members of the elder branch, the only notable one was Vincenzo I. (1562–1612), to whom the Admirable Crichton was tutor, and by whom he was murdered from jealousy in 1582. This branch became extinct in 1627 through the death of Vincenzo II., sixth successor of Frederick II. The nearest heir was Carlo I., duke of Nevers, who was recognized by the Mantuans, but his claims were contested by Ferdinand II. of Guastella, who had the support of the emperor Ferdinand II. In the war which followed, the duke of Nevers obtained the assistance of Louis XIII. of France, but in 1630 Mantua was captured and pillaged by the imperial troops, and the duke was forced to retire to the States of the Church. In 1631 a treaty was, however, concluded between France and the emperor, by which the duke, on making submission, was reinvested with the duchies of Mantua and Montferrat. Anna, a daughter of Carlo I., became wife of Edward, elector-palatine of the Rhine, and after playing a distinguished part at the French court, died

at Paris in 1684, leaving behind her a volume of interesting *Memoirs* (London and Paris, 1686). Carlo died in 1639, and was succeeded by his grandson Carlo III., who, on his death in 1665, was succeeded by his son Carlo IV. This duke married in 1670 Anna Isabella, eldest daughter of Ferdinand duke of Guastella; and on the death of Ferdinand in 1679, he endeavoured to obtain possession of that duchy, but was compelled to relinquish his claims to Vincenzo, a cousin-german of the deceased duke. He took part on the side of France in the Spanish succession war, and received a French garrison into Mantua. After the defeat of the French he was placed under the ban by the emperor Joseph I., whereupon Victor Amadeus of Savoy conquered Montferrat, and Austria, in agreement with France whom Carlo had offended, took possession of Mantua. On his death without issue in 1708, the dynasty of the Gonzagas of Mantua became extinct.

GONZAGA, THOMAS ANTONIO (1744–1809), “the Portuguese Petrarch,” perhaps better known as DIRCEU, was born at Oporto in 1744, and received his early education there and at Bahia, where his father, after having held various judicial appointments, became a member of the supreme court in 1759. Having completed his law studies at the university of Coimbra, which he attended from 1763 to 1768, Gonzaga in the latter year returned to Brazil, and after having acted for some years as juiz de fora or local magistrate at Beja and elsewhere he ultimately was appointed a judge (ouvidor) at Villa-Rica in the province of Minas, where he highly distinguished himself it is said both by his administrative ability and by the many excellences of his private character. He appears before this time to have developed some talent for versification, and his literary tastes soon brought him into intimate association with Claudio Manoel, Alvarenga Peixoto, and other writers of the so-called Minas school; but the love which makes the poet did not, in his own opinion at least, come upon him until he had made the acquaintance (about 1788) of D. Maria Joaquina Dorothea de Seixas, the “Marilia de Dirceu” to whom all his extant poems relate. He had just been nominated a member of the supreme court of Bahia, and was on the eve of his marriage, when discovery was made of the treasonable plot of Minas, and he was arrested on suspicion of having been implicated in it. On merely circumstantial evidence, and that of a very inconclusive kind, he was condemned, 18th April 1792, to banishment for life to Pedras de Angoche, a sentence which was afterwards commuted to one of ten years’ exile at Mozambique. Here he made some effort to practise as an advocate, but he never recovered from the wearing-out depression into which he had been thrown by his cruel lot; an attack of nervous fever undermined his health, and after years of an ever-deepening melancholy, which occasionally alternated with fits of acute mania, he died in 1809.

His collection of poems, entitled *Marilia de Dirceu*, consists of two parts. In the first of these, the charms of Marilia and his own happiness in the love he bears to her are his endlessly varied theme. The second, written during his imprisonment, is full of laments over his terrible fate, protestations of his innocence, and many fine expressions of the support and comfort he still finds in the remembrance of his love. Almost everywhere these “lyras” plainly enough betray a conscious imitation of Petrarch or other models; but they also exhibit an imaginative charm, a naturalness and delicacy of feeling, a harmoniousness of diction, and a gracefulness of versification which, in the unanimous opinion of competent critics, entitle them to rank among the best love lyrics in the language. In Brazil their popularity, perhaps aided by feelings of sympathy for their unfortunate author, has from the first been very great. The editions are very numerous, the best probably being that of J. M. P. da Sylva which is accompanied with an historical and biographical introduction (1845). A critical notice, along with selections from the poems of Gonzaga, will be found in Wolf’s *Brasil Littéraire* (1863). They have been translated into French by Monglave and Chalas (1825), into Spanish by Vedia, and into Italian by Ruscalla.

GONZALO DE BERCEO, mystic and didactic poet, and one of the earliest names in Castilian literature, was parish priest at Berceo, near San Domingo de la Calzada, in the province of Burgos, and lived, it is believed, during the first sixty years of the 13th century. His works, which are reprinted in the *Poesías Castellanas Anteriores al Siglo XV.* of Sanchez, amount to upwards of 13,000 lines of verse, chiefly in rhymed quatrains. The subjects chosen for treatment are the Lives of San Domingo de Silos, Santa Oria, and San Millan; the Sacrifice of the Mass; the Miracles, Glories, and Pains of the Blessed Virgin; the Signs of the Day of Judgment; and the Martyrdom of San Lorenzo. Apart from the interest which attaches to them in the eyes of the literary and ecclesiastical archæologist, they have little to attract the modern reader. The monotony of their "sermo pedestris" is but seldom relieved by any touches of poetical genius; in some places, however, as Ticknor remarks, there is a simple-hearted piety that is very attractive, and in others a power in story-telling that is very striking. The poem on the Miracles of the Virgin, which is the largest, is also the most curious; but that upon the Signs of the Last Day is often very solemn, while the Mourning of Mary at the Cross breathes such a childlike spirit of gentle, faithful, credulous devotion as enables one to realize with some vividness many of the best characteristics of the religious life of the time.

See Ticknor, *History of Spanish Literature*; and Carus, *Darstellung der Spanischen Literatur* (1846); also Dunham's *History of Spain and Portugal*, vol. iv. (1832).

GONZALO FERNANDEZ Y AGUILAR (1453–1515), commonly known as Gonsalvo de Cordova, El Gran Capitan ("The Great Captain"), was born at Montilla on the 16th of March 1453, and in his fifteenth year was presented to Queen Isabella at Segovia, where his manly beauty, his graceful manners, and his soldierly accomplishments speedily made him conspicuous in the court. He first saw active military service in Portugal under Alonzo de Cardenas, and gained special praise for his conduct on the battlefield of Albuera in 1479. In the protracted Moorish war begun in 1481, he served with distinction in various capacities, and was finally employed to conduct the peace negotiations with Abdallah. For his efficient services in this business he was rewarded with a pension and a grant out of the conquered territory (1492). When, in consequence of the advance of Charles VIII. into Italy, a Spanish expedition was decided upon in 1495, Gonzalo was selected for the chief command; and although at Seminara near Reggio, through the interference of the friendly Ferdinand of Naples, he lost the battle (it was the only occasion on which he ever was defeated), he gained in reputation both for prudence and for bravery. In spite of his subsequent successes in Lower Calabria, the campaign of this year closed with indecisive results; but in the opening of the following season, he still further increased his fame by his brilliant surprise and capture of Laino, and by his junction with the Neapolitan forces before Atella, after an arduous march through hostile territory. It is most commonly, and with most probability, said to have been on this occasion that he received the honourable title of El Gran Capitan, by which the Spaniards still delight to designate him. The conquest of Calabria having been thus rapidly achieved, he, at the pope's invitation, proceeded to clear Ostia of the French garrison by which it had been held, and shortly afterwards entered Rome itself, where he was greeted by the populace as "deliverer of the city." The object of his expedition, the total expulsion of the French from Neapolitan territory, having been fully attained, he, in August 1498, returned to Spain, where he was received with the utmost enthusiasm by all classes, the king publicly declaring that the reduction of Naples, and the humiliation inflicted on the French,

reflected more lustre on his crown than the conquest of Granada. After having, early in 1500, efficiently co-operated with Tendilla in putting down the Moorish insurrection in the Alpujarras, Gonzalo, in May of the same year, took command of an armada designed to operate on the coast of Sicily and in the Levant, and generally to uphold the influence of Spain. In conjunction with the Venetian admiral he stormed St George in Cephalonia, in January 1501; and soon afterwards returning to Sicily, commenced operations against Frederick in accordance with the treaty concluded between France and Spain for the partition of Naples. The whole of Calabria was occupied in less than a month, with the exception of Tarento, which did not surrender until March 1502. On the outbreak of hostilities between France and Spain in July of the same year, Gonzalo was compelled to fall back upon Barletta, whence, after having sustained a memorable siege of nearly ten months, he sallied in April 1503, and coming upon the French troops at Cerignola, inflicted on them a disastrous defeat, which at once made him master of the city of Naples and of the greater part of the kingdom. A subsequent victory at the bridge of Garigliano (29th December 1503) gave him Gaeta, and terminated the war. For more than three years he continued to act with popularity and efficiency at Naples as Ferdinand's viceroy; but the jealousy and distrust of that somewhat narrow-minded monarch led to his recall in 1507, and to his subsequent retirement from court shortly afterwards. The remainder of his days were passed on his estate at Loja, where, in the midst of preparations for a voyage to Flanders, he was seized with a fever, of which he died, 2d December 1515.

The life of "the great captain" has been rather a favourite subject with literary men, having been treated by Giovio in his *Vitæ Illustrum Virorum*, and by Quintana in his *Españoles Célebres*, as well as by Florian (*Gonsalve de Cordoue, ou Grenade Reconquise*, 1791), Duponcet (*Histoire de Gonsalve de Cordoue*, 1714), and an anonymous author, sometimes supposed to be Pulgar (*Crónica del Gran Capitan*, 1584). A skilful and judicious use of all these sources has been made by Prescott in his *History of the Reign of Ferdinand and Isabella*, where the purity, generosity, and loyalty of the private character of Gonzalo, as well as the coolness, sobriety, and energy of his military genius, are very fully and vividly illustrated.

GOOD, JOHN MASON (1764–1827), a writer on medical, religious, and classical subjects, was born May 25, 1764, at Epping, Essex, where his father, the Rev. Peter Good, was Independent minister. After receiving his education in the seminary conducted by his father, he was, at about the age of fifteen, apprenticed to a surgeon-apothecary at Gosport. In 1783 he went to London to prosecute his medical studies, and in the autumn of 1784 he commenced practice as a surgeon at Sudbury in Suffolk. Through an obligation rendered to a friend he, in 1792, got into pecuniary embarrassment, and, with a view to surmount his difficulties, he removed in 1793 to London, where he entered into partnership with a surgeon and apothecary who enjoyed an extensive practice. In November of the same year he was admitted a member of the college of surgeons. On account of disagreements with his colleague, the partnership was soon afterwards dissolved, and to increase his income he now devoted more of his attention to literary pursuits. Besides contributing both in prose and poetry to the *Analytical and Critical Reviews*, and the *British and Monthly Magazines*, and other periodicals, he is the author of a large number of works relating chiefly to medical and religious subjects. In 1794 he became a member of the British Pharmaceutical Society, and in that connexion, and especially by the publication of his work, *A History of Medicine*, he did much to effect a greatly needed reform in the profession of the apothecary. In 1820 he took the diploma of M.D. at Marischal College, Aberdeen. He died, January 2, 1827. Dr Good was not only well versed in classical

literature, but was acquainted with the principal European languages, and also with Persian, Arabic, and Hebrew. His prose works display wide erudition and considerable intellectual vigour, and contain much interesting and curious information; but their style is dull and tedious, and they are now very generally forgotten. His poetry never rises above pleasant and well-versed commonplace.

The following are his principal writings:—*Maria*, an elegiac ode, 1786; *Diseases of Prisons and Poorhouses*, 1795; *History of Medicine*, 1795; *Parish Workhouses*, 1798; *Song of Songs*, translated from the Hebrew, with notes critical and explanatory, 1803; *Triumph of Britain, an Ode*, 1803; *Memoirs of the Life and Writings of Alex. Geddes, LL.D.*, 1803; *The Nature of Things: a Didactic Poem*, translated from the Latin of Titus Lucretius Carus, with the original text and notes philological and explanatory, 1805–7, 2 vols. 4to, which is still of considerable value for its parallel passages and quotations both from European and Asiatic languages; *Oration on the Structure and Physiology of Plants*, 1808; *Essay on Medical Technology*, 1810; *The Book of Job literally translated*, &c., 1812; *The Study of Medicine*, 1822, 4 vols. 8vo, 3d ed. in 1832, edited by Dr Samuel Cooper; and *The Book of Nature*, 1826, 3 vols. See *Memoirs* by Olinthus Gregory, LL.D., 1828, and a biographical sketch in the *Gentleman's Magazine* for March 1827. His *Thoughts for all Seasons, in Prose and Verse*, was published, with a short biographical sketch, in 1860.

GOOD FRIDAY, the usual English name for the day observed throughout a great part of Christendom as the anniversary of the passion and death of Christ. In the Greek Church it has been or is known as *πάσχα* [*σταυρώσιμον*], *παρασκευή*, *παρασκευή μεγάλη* or *ἀγία*, *σωτηρία* or *τὰ σωτήρια*, *ἡμέρα τοῦ σταυροῦ*, while among the Latins the names of most frequent occurrence are *Pascha Crucis*, *Dies Dominicæ Passionis*, *Parasceve*, *Feria Sexta Paschæ*, *Feria Sexta Major* in Hierusalem, *Dies Absolutionis*. It was called Long Friday by the Anglo-Saxons<sup>1</sup> and Danes; in Germany it is sometimes designated *Stiller Freitag* (compare Greek, *ἡβδόμης ἀπρακτος*; Latin, *hebdomas inofficiosa*, non laboriosa), but more commonly *Charfreitag*. The etymology of this last name has been much disputed, but there seems now to be little doubt that it is derived from the Old High German *chara*, meaning suffering or mourning.

The origin of the custom of a yearly commemoration of the crucifixion is involved in some obscurity. It may be regarded as certain, indeed, that among Jewish Christians it almost imperceptibly grew out of the old habit of annually celebrating the Passover on the 14th of Nisan, and of observing the "days of unleavened bread," from the 15th to the 21st of that month. In the Gentile churches, on the other hand, it seems to be well established that originally no yearly cycle of festivals was known at all. The weekly observance of the dies dominica, however, became universal at a very early date; and the practice of giving special prominence to Easter Sunday (the first Sunday after the 14th of Nisan), as well as that of keeping a previous fast of considerable rigour, though of indeterminate duration, had established itself in Egypt and in the Western churches at least by the middle of the 2d century. The accounts which have been transmitted by Eusebius, Socrates, and Epiphanius of the paschal controversies, which began to be agitated about 160 A.D., are obscure on many points—so obscure, indeed, as to suggest doubts whether these historians had altogether comprehended the questions under discussion. So much, however, is clear, that Occidental feeling had even then begun to take great offence at the prevailing Eastern practice. In Asia Minor, Syria, and Mesopotamia, the 14th and 16th of Nisan were specially observed, altogether irrespective of the day of the week, and for this apostolic sanction was urged by Polycarp; but Anicetus of Rome, with great earnestness, though still with deference, pleaded immemorial usage for the custom of observing a

Friday and Saturday fast followed by an Easter Sunday feast. As the Western churches gained in influence, the practice of tolerance became increasingly difficult; already in 190 A.D. we find Victor of Rome insisting on the conformity of Polycrates of Ephesus, and proclaiming the contumacious Asiatics to be out of communion (*ἀκοινωνήτους*). To secure uniformity in this matter was one of the objects for which the council of Nice was convened in 325; no canon, however, was framed by the fathers there assembled, but it was recommended in a circular letter that Easter (*πάσχα*) should invariably be observed on a Sunday, and that the passion should, with equal regularity, be commemorated on Friday. Considerable progress towards the compulsory establishment of a uniform paschal usage was made in the years immediately following; thus, by a canon of the council of Antioch (341), the followers of the Oriental use were laid under severe ecclesiastical censures; in the decrees of that of Laodicea (361) the ominous word *αἵρεσις* is heard (*αἵρεσις τῶν τεσσαρεσκαίδεκατῶν*); while in the Theodosian Code (xvi. 5, 9; 6, 6; 10, 24), the Quartodecimans are formally ranked among the other heretics whose error is to be visited with civil pains and penalties.

From the earliest period of its observance, the day was marked by a specially rigorous fast, and also, on the whole, by a tendency to greater simplicity in the public services of the church. Prior to the 4th century there is no evidence of non-celebration of the eucharist on Good Friday; but after that date the prohibition of communion became common. In Spain, indeed, it became customary to close the churches altogether as a sign of mourning; but this practice was condemned by the council of Toledo (633). In the Romish Church the Good Friday ritual at present observed is marked by many special features, most of which can be traced back to a date at least prior to the close of the 8th century (see the *Ordo Romanus* in Muratori's *Liturg. Rom. Vet.*). The altar and officiating clergy are draped in black, this being the only day on which that colour is permitted. Instead of the epistle, sundry passages from Hosea, Habakkuk, Exodus, and the Psalms are read. The gospel for the day consists of the history of the passion as recorded by St John. The reading of this is followed by bidding prayers for the peace and unity of the church, for the pope, the clergy, all ranks and conditions of men, the sovereign, for catechumens, the sick and afflicted, heretics and schismatics, Jews and heathen. Then follows the "adoration of the cross" (a ceremony said to date back to near the time of Helena's "invention of the cross"); the hymns *Pange Lingua* and *Vexilla Regis* are sung, and the reserved host brought out and partaken of by the priest. In many Roman Catholic countries, as, for example, in Spain, it is usual with the faithful to spend much time in the churches in meditation on the "seven last words" of the Saviour; no carriages are driven through the streets; the bells and organs are silent; and in every possible way it is sought to deepen the impression of a profound and universal grief. In the Greek Church also the Good Friday fast is excessively strict; as in the Roman Church, the passion history is read and the cross adored; towards evening a dramatic representation of the entombment takes place, amid open demonstrations of contempt for Judas and the Jews. In Lutheran churches the organ is silent on this day; and altar, font, and pulpit are draped in black, as indeed throughout Holy Week. In the Church of England the history of the passion from the gospel according to John is also read; the collects for the day are based upon the bidding prayers which are found in the *Ordo Romanus*.

GOODRICH, SAMUEL GRISWOLD (1793–1860), an American author better known under the pseudonym of Peter Parley, was the son of a Congregational minister, and was born at Ridgefield, Connecticut, August 19, 1793. In

<sup>1</sup> See Johnson's *Collection of Ecclesiastical Laws* (vol. i., anno 957): "Housel ought not to be hallowed on Long Friday, because Christ suffered for us on that day."

1814 he commenced business as a publisher in Hartford. He visited Europe in 1823-4, and on his return to America removed to Boston, where from 1828 to 1842 he published an illustrated journal, the *Token*, to which he was a frequent contributor both in prose and verse. A selection from these contributions was published in 1841 under the title *Sketches from a Student's Window*. In the same year he established *Merry's Museum*, which he continued to edit till 1854. In 1827 he commenced, under the name of "Peter Parley," his series of books for the young, which, embracing geography, biography, history, science, and miscellaneous tales, numbered in 1857 as many as 170 volumes, of which about 7,000,000 had been sold, and 300,000 were being sold annually. In 1858 he published *Recollections of a Lifetime*, which contains a list both of the works of which he was the author and of the spurious works published under his name. By his writings and publications he amassed a large fortune. In 1838 he was chosen a member of the senate of Massachusetts, and in 1851 he was appointed consul to Paris, where he remained till 1855, taking advantage of his stay to have several of his works translated into French. After his return to America he published, in 1859, *History of the Animal Kingdom*. He died at New York, May 9, 1860.

GOODSIR, JOHN (1814-1867), anatomist, born at Anstruther, Fife, March 20, 1814, was the son of Dr John Goodsir, and grandson of Dr John Goodsir of Largo. He was educated at the burgh and grammar schools of his native place, and at the university of St Andrews. He served an apprenticeship for a short time to Mr Nasmyth, the eminent dentist, but the higher studies of medicine and surgery were more to his liking, and, under the fascinating impulsion of the lectures of Dr Knox, anatomy, descriptive, surgical, and pathological, became his hobby,—the work of Carus giving the first impetus to his investigations in developmental anatomy. From his mother he had imbibed a love of art, and his sketches and casts and methodical demonstrations were the admiration of his fellow students. In Dr Knox's rooms he made the acquaintance of Edward Forbes, the naturalist. Goodsir also worked under Mr Syme, Professor Christison, Dr John Macintosh, Professor Robert Jameson, Dr Thomas Hope, and Dr Graham. His earliest scientific paper was on the snail,—a novel, elaborate, and highly illustrated treatise. In 1835 he became a licentiate of the Royal College of Surgeons, Edinburgh. After aiding Mr Nasmyth, he joined his father in practice at Anstruther. Three years later he communicated to the British Association a paper on the pulps and sacs of the human teeth, his researches on the whole process of dentition being at this time distinguished by their completeness. He had already commenced the formation of a natural history museum, which attracted many visitors,—the habits of animals, from the polype to the ape, possessing an irresistible charm for him. The results of his studies in natural history were laid before the Society of St Andrews, at the request of whose president, Sir D. Brewster, he furnished an account of *cilia*, reading to the society in 1840 his views on the cephalic termination of the sympathetic nerve. The ichthyolites of the Concerres quarry had not escaped him; and we find him now foreshowing his diversified knowledge in essays on the eye of the cephalopodous mollusks, in descriptions of his dredging expeditions with Edward Forbes, and in his lectures at Cupar on the conditions of health. On the nomination of Forbes, he was in 1838 elected to the famous coterie called the "Universal Brotherhood of the Friends of Truth," which comprised artists, scholars, naturalists, and others whose relationship became a potent influence in science. Goodsir was a noble example of the brotherhood, which sought to bind man to man in ties of home and friendship, love and good will. Goodsir and Forbes worked together at marine zoology, but human

anatomy, pathology, and morphology formed Goodsir's chief study. The connexion of these two men was illustrated in a paper read at the British Association in 1840 on *Peloniaia*, and further researches on the British *Ciliograda*. In that year Goodsir became a member of the Wernerian Society, contributing several papers, some jointly with Forbes. Professor Jameson was the president, which may account for the greater part of Goodsir's studies in comparative anatomy from 1840 to 1847 being imparted to its members. In 1841 he joined the Edinburgh Botanical Society, holding the office of secretary from 1842-48, when he was chosen vice-president. In 1840-42 ulcers and abscesses and continued fever, in cases of which he advocated the depletive system, occupied his attention. He had associated himself with the Royal Medical Society in 1833, and was in 1841-42 elected the senior president, at the same time becoming president of the Anatomical and Physiological Societies, to which he submitted his studies on the structure of the liver and kidneys. A member of the Royal Physical Society in 1841, he read his papers on the development of the skeleton in the series of invertebrate animals; in 1849 he was elected president, remaining in office till 1852. His own estimate of his work at this period was represented to the Royal College of Surgeons of Edinburgh on his candidature for the post of conservator of the museum. He stated that he had practised every department of preparation and conservation, that he had considerable experience in modelling in clay, plaster, and wax, and in the use of microscope and pencil, and that his own collection of preparations in human, comparative, and morbid anatomy exceeded 400 examples. He succeeded Macgillivray in April 1841, giving lectures on the subjects illustrated by the museum. Goodsir rested no small part of his reputation on his knowledge of the anatomy of tissues. In his lectures in the theatre of the college in 1842-43 he evidenced the largeness of his observation of cell-life, both physiologically and pathologically, advocating the importance of the cell as a centre of nutrition, and pointing out that the organism is subdivided into a number of departments. Virchow recognized his indebtedness to these discoveries by dedicating his *Cellular Pathologie* to Goodsir, as "one of the earliest and most acute observers of cell-life." In 1843 Goodsir obtained the post of curator in the university of Edinburgh; the following year he was appointed demonstrator of anatomy to Professor Monro, and in 1845 curator of the entire museum. He elucidated about this time much that had been obscure in digestion, in parasitic formation and in the secreting structures. He fully confirmed the supposition that cells are the structures which perform the process of secretion, and that the functions of nutrition and secretion are essentially alike in their nature. His views on the nucleated cell as the great agent in absorption, nutrition, and secretion are established data in the science of physiology. In 1846 Goodsir was elected to the anatomical chair in the university of Edinburgh, his highest ambition being thus satisfied. The same year the Royal Society of London enrolled him as a fellow. All his energies were now devoted to the perfection of the science of anatomy; and his system of teaching was regarded as the best that ever regulated the anatomical department of any British university or medical school.

Human myology was his strong point; no one had laboured harder at the dissecting-table; and he strongly emphasized the necessity of practice as a means of research. He believed that anatomy, physiology, and pathology could never be properly advanced without daily consideration and treatment of disease. In 1848 he became a fellow of the Royal College of Surgeons, and in the same year he joined the Highland and Agricultural Society, acting as chairman of the veterinary department, and advising on

strictly agricultural matters. In 1847 he delivered a series of systematic lectures on the comparative anatomy of the invertebrata; and, about this period, as member of an æsthetic club, he wrote papers on the natural principles of beauty, the æsthetics of the ugly, of smell, the approbation or disapprobation of sounds, and other refinements. Owing to the failing health of Professor Jameson, Goodsir was induced to deliver the course of lectures on natural history during the summer of 1853. It was mainly zoological, and included the psychological conditions of man as compared with the brute, and the highest exercise of the human faculties—perception, logic, and science. These lectures are among the *memorabilia* of the university; but the infinite amount of thought and exertion which they cost broke the health of the lecturer. Goodsir, nevertheless, persisted in work till 1853, when the necessity for rest urged itself with painful force. A sojourn on the Continent, though it refreshed, could not rid him of incipient paralysis, the common penalty for overtaxing powers. The death of Forbes in 1854 was a sore trial to Goodsir, and though other friends were numerous, the firm attachment of this man could not be replaced. Goodsir persevered in his labours, writing in 1855 on organic electricity, in 1856 on morphological subjects, and afterwards on the structure of organized forms,—his speculations in the latter domain giving birth to his theory of a triangle as the mathematical figure upon which nature had built up both the organic and inorganic worlds. The fundamental principle of form he conceived to exist within the province of crystallography, and to be discernible by a close study of the laws of that science. As he believed that every cell had a parent cell, or “a mother,” so he argued there was an umbilicus or centre in everything. He regarded man as simply a conglomerate of cells, rising up, maturing, and decaying. He saw in the growth and form and finished structure of man a tetrahedron,—man, a physical being and a form divine, but a crystal in his structural entity and arrangement. Goodsir hoped to complete the triangle theory of formation and law as the greatest of his works. In his lectures on the skull and brain he held the doctrine that symmetry of brain had more to do with the higher faculties than bulk or form. Goodsir was still working out these higher studies when death ended his labours. He expired at Wardie, near Edinburgh, on the 6th of March 1867, in the same cottage in which his friend Edward Forbes died. Goodsir's anatomical lectures are remarkable for their solid basis of fact; and no one in Britain took so wide a field for survey, or marshalled so many facts for anatomical tabulation and synthesis.

See *Anatomical Memoirs of John Goodsir, F.R.S., edited by W. Turner, M.B., with Memoir by H. Lonsdale, M.D.*, Edinb. 1868, 2 vols., in which Goodsir's lectures, addresses, and writings are epitomized; *Proceedings of the Roy. Soc. of Lond.*, vol. iv., 1868; *Transactions of the Botanical Soc. Edin.*, 1868, vol. ix. (T. N.)

GOODWIN, THOMAS (1600–1679), a prominent English divine of the later Puritan period, was born at Rollesby, Norfolk, on the 5th of October 1600, and a little before the completion of his thirteenth year was enrolled a student of Christ's College, Cambridge, where in 1616 he proceeded to the degree of B.A. In 1619 he removed to St Catherine's Hall, and there in 1620 he was chosen fellow. In 1625 he was licensed a preacher of the university; and three years afterwards he became lecturer of Trinity Church, to the vicarage of which he was presented by the king in 1632. Harassed by the interferences of his bishop, who was a zealous adherent of Laud, he resigned all his preferments and left the university in 1634. He then seems to have lived for some time in London, where in 1638 he married the daughter of an alderman; but, in the following year, he found it expedient to withdraw to Holland, and for some time was pastor of a small congregation of

English merchants and refugees at Arnheim. Returning to London soon after Laud's impeachment by the Long Parliament, he ministered for some years to an Independent congregation in the parish of St Dunstan's-in-the-East, and rapidly rose to considerable eminence as a preacher; in 1643 he was chosen a member of the Westminster Assembly, and at once identified himself with the Congregational party, generally referred to in contemporary documents as “the dissenting brethren.” He frequently preached by appointment before the Commons, and in January 1650 his talents and learning were rewarded by the House with the presidentship of Magdalen College, Oxford, a post which he held until the period of the Restoration. He rose into high favour with the Protector, and ultimately became somewhat prominent among his more intimate advisers. From 1660 until his death, which occurred on the 23d of February 1679, he lived in London, and devoted himself exclusively to theological study and to the pastoral charge of a small congregation which his piety and intellectual abilities had attached to him.

The works published by Goodwin during his lifetime consist chiefly of sermons printed by order of the House of Commons; but he was also associated with Nye and others in the preparation of the *Apologeticall Narration* (1648). His collected writings, which include expositions of considerable portions of the Epistle to the Ephesians and of the Apocalypse, were published in five folio volumes between 1681 and 1704, and have recently been reprinted in twelve 8vo volumes (Edin. 1861–66). Characterized by great yet one-sided reading, remarkable at once for the depth and for the narrowness of their observation and spiritual experience, often admirably thorough in their workmanship, yet in style prolix to a degree that, by modern readers at least, is sometimes found to be almost intolerable,—they fairly exemplify both the merits and the defects of the special school of religious thought to which they belong. Calamy's estimate of Goodwin's qualities may be quoted as both friendly and just. “He was a considerable scholar and an eminent divine, and had a very happy faculty in descanting upon Scripture so as to bring forth surprising remarks, which yet generally tended to illustration.” A memoir, derived from his own papers, by his son is prefixed to the fifth volume of his collected works; as a “patriarch and Atlas of Independency” he is also noticed by Wood in the *Athenæ Oxonienses*. A somewhat amusing sketch, from Addison's point of view, of the Puritan president of Magdalen's is to be met with in No. 494 of the *Spectator*.

GOOJERAT. See GUJARAT.

GOOLE, a market town and river-port of England, West Riding of Yorkshire, is situated on the right bank of the Ouse, 25 miles W. of Hull, on the Hull and Doncaster Railway, and at the eastern terminus of the Wakefield, Pontefract, and Goole branch of the Lancashire and Yorkshire Railway. About a mile north of Goole the Ouse is crossed by a railway swing bridge, worked by hydraulic power. Until it was made a bonding port in 1829, Goole was an obscure hamlet; but since the erection shortly afterwards of commodious docks, it has steadily advanced in prosperity. The harbour, 250 feet long and 200 wide, communicates by gates with the wet docks, which consist of the ship dock 700 feet by 200, with a depth of 18 feet, the railway dock 600 feet by 200, and the steamship dock 900 feet by 150. The town is well built, and possesses a fine modern parish church in the Perpendicular style, a Roman Catholic chapel in the Early English style, a neat custom-house, a market hall, a handsome courthouse, a union poorhouse, public, free, and national schools, and extensive warehouses for grain and other goods. The number of British ships that entered the port in 1877 was 1686, with a tonnage of 298,150; of foreign ships 62, with a tonnage of 16,399. The number of British ships that cleared was 2642, with a tonnage of 342,727; of foreign ships 64, with a tonnage of 17,038. There is regular steam communication with London and the principal Continental ports. The chief exports are coal, woollen goods, and machinery; and the chief imports, butter, fruit, indigo, logwood, timber, and wool. The

industries include the manufacture of alum, sugar, ropes, and agricultural instruments, and iron-founding. Shipbuilding is also carried on, and there is a large dry dock, and a patent slip for repairing vessels. The population in 1871 was 7680.

GOOSANDER. See MERGANSER.

GOOSE (Anglo-Saxon, *Gōs*), the general English name for a considerable number of birds, belonging to the Family *Anatidæ* of modern ornithologists, which are mostly larger than Ducks and less than Swans. Technically the word Goose is reserved for the female, the male being called Gander (Anglo-Saxon, *Gandra*).

The most important species of Goose, and the type of the genus *Anser*, is undoubtedly that which is the origin of our well-known domestic race, the *Anser ferus* or *A. cinereus* of most naturalists, commonly called in English the Grey or Grey Lag<sup>1</sup> Goose, a bird of exceedingly wide range in the Old World, apparently breeding where suitable localities are to be found in most European countries from Lapland to Spain and Bulgaria. Eastwards it extends to China, but does not seem to be known in Japan. It is the only species indigenous to the British Islands, and in former days bred abundantly in the English Fen-country, where the young were caught in large numbers and kept in a more or less reclaimed condition with the vast flocks of tame-bred Geese that at one time formed so valuable a property to the dwellers in and around the Fens. It is impossible to determine when the wild Grey Lag Goose ceased from breeding in England, but it certainly did so towards the end of the last century, for Daniell mentions (*Rural Sports*, iii. p. 242) his having obtained two broods in one season. In Scotland this Goose continues to breed sparingly in several parts of the Highlands and in certain of the Hebrides, the nests being generally placed in long heather, and the eggs seldom exceeding five or six in number. It is most likely the birds reared here that are from time to time obtained in England, for at the present day the Grey Lag Goose, though once so numerous, is, and for many years has been, the rarest species of those that habitually resort to the British Islands. The domestication of this species, as Mr Darwin remarks (*Animals and Plants under Domestication*, i. p. 287), is doubtless of very ancient date, and yet scarcely any other animal that has been tamed for so long a period, and bred so largely in captivity, has varied so little. It has increased greatly in size and fecundity, but almost the only change in plumage is that tame Geese lose the browner and darker tints of the wild bird, and are invariably more or less marked with white—being often indeed wholly of that colour.<sup>2</sup> The most generally recognized breeds of domestic Geese are those to which the distinctive names of Emden and Toulouse are applied; but a singular breed, said to have come from Sebastopol, was introduced into Western Europe about the year 1856. In this the scapulars are elongated, curled, and spirally twisted, having their shaft

transparent, and so thin that it often splits into fine filaments, which, remaining free for an inch or more, often coalesce again.<sup>3</sup>

The other British species of typical Geese are the Bean-Goose (*A. segetum*), the Pink-footed (*A. brachyrhynchus*), and the White-fronted (*A. albifrons*). On the continent of Europe, but not yet recognized as occurring in Britain, is a small form of the last (*A. erythropus*) which is known to breed in Lapland. All these, for the sake of discrimination, may be divided into two groups—(1) those having the "nail" at the tip of the bill white, or of a very pale flesh colour, and (2) those in which this "nail" is black. To the former belong the Grey Lag Goose, as well as *A. albifrons* and *A. erythropus*, and to the latter the other two. *A. albifrons* and *A. erythropus*, which hardly differ but in size,—the last being not much bigger than a Mallard (*Anas boschas*),—may be readily distinguished from the Grey Lag Goose by their bright orange bill and legs, and their mouse-coloured upper wing-coverts, to say nothing of their very conspicuous white face and the broad black bars which cross the belly, though the two last characters are occasionally observable to some extent in the Grey Lag Goose, which has the bill and legs flesh-coloured, and the upper wing-coverts of a bluish-grey. Of the second group, with the black "nail," *A. segetum* has the bill long, black at the base and orange in the middle; the feet are also orange, and the upper wing-coverts mouse-coloured, as in *A. albifrons* and *A. erythropus*, while *A. brachyrhynchus* has the bill short, bright pink in the middle, and the feet also pink, the upper wing-coverts being nearly of the same bluish-grey as in the Grey Lag Goose. Eastern Asia possesses in *A. grandis* a third species of this group, which chiefly differs from *A. segetum* in its larger size. In North America there is only one species of typical Goose, and that belongs to the white-"nailed" group. It very nearly resembles *A. albifrons*, but is larger, and has been described as distinct under the name of *A. gambeli*. Central Asia and India possess in the Bar-headed Goose (*A. indicus*) a bird easily distinguished from any of the foregoing by the character implied by its English name; but it is certainly somewhat abnormal, and, indeed, under the name of *Eulabia*, has been separated from the genus *Anser*, which has no other member indigenous to the Indian Region, nor any at all to the Ethiopian, Australian, or Neotropical Regions.

But the New World possesses by far the greatest wealth of Anserine forms. Beside others, presently to be mentioned, its northern portions are the home of all the species of Snow-Geese belonging to the genus *Chen*. It is true that two of these are reported as having appeared, and that not unfrequently, in Europe and Asia; but they possibly have been but stragglers from America. The first of these is *C. hyperboreus*, the Snow-Goose proper, a bird of large size, and when adult of a pure white, except the primaries, which are black. This has long been deemed a visitor to the Old World, and sometimes in considerable numbers, but the later discovery of a smaller form, *C. albatrus*, scarcely

<sup>1</sup> The meaning and derivation of this word *Lag* had long been a puzzle until Prof. Skeat suggested (*Ibis*, 1870, p. 301) that it signified late, last, or slow, as in *laggard*, a loiterer, *lagman*, the last man, *lagteeth*, the posterior molar or "wisdom" teeth (as the last to appear), and *lagclock*, a clock that is behind time. Thus the Grey Lag Goose is the Grey Goose which in England when the name was given was not migratory but *lagged* behind the other wild species at the season when they betook themselves to their northern breeding-quarters. In connexion with this word, however, must be noticed the curious fact mentioned by the late Mr Rowley (*Orn. Miscell.*, iii. p. 213), that to this day the flocks of tame Geese in Lincolnshire are urged on by their drivers with the cry of "Lag'em, Lag'em."

<sup>2</sup> From the times of the Romans white Geese have been held in great estimation, and hence, doubtless, they have been preferred as breeding stock, but the practice of plucking Geese alive, continued for so many centuries, has not improbably also helped to perpetuate this variation, for it is well known to many bird-keepers that a white feather is often produced in place of one of the natural colour that has been pulled out.

<sup>3</sup> Want of space forbids our entering on the breeding of tame Geese, which was formerly so largely practised in some English counties, especially Norfolk and Lincoln. It was no uncommon thing for a man to keep a stock of a thousand, each of which might be reckoned to rear on an average seven Goslings. The flocks were regularly taken to pasture and water, just as sheep are, and the man who tended them was called the Gooseherd, corrupted into Gozzerd. The birds were plucked five times in the year, and in autumn the flocks were driven to London or other large markets. They travelled at the rate of about a mile an hour, and would get over nearly ten miles in the day. For further particulars the reader may be referred to Pennant's *British Zoology*; Montagu's *Ornithological Dictionary*; Latham's *General History of Birds*; and Rowley's *Ornithological Miscellany* (iii. pp. 206-215), where some account also may be found of the Goose-fattening at Strasburg, which, since the reconquest of Alsace, has been transferred to the south of France.

differing except in size, throws some doubt on the older records, especially since examples which have recently been obtained in the British Islands undoubtedly belong to this lesser bird, and it would be satisfactory to have the occurrence in the Old World of the true *C. hyperboreus* placed on a surer footing. So nearly allied to the species last named as to have been often confounded with it, is the Blue-winged Goose, *C. caerulescens*, which is said never to attain a snowy plumage. Then we have a very small species, long ago described as distinct by Hearne, the Arctic traveller, but until 1861 discredited by ornithologists. Its distinctness has now been fully recognized, and it has received, somewhat unjustly, the name of *C. rossi*. Its face is adorned with numerous papillæ, whence it has been removed by Mr Elliot to a separate genus, *Exanthemops*, and for the same reason it has, for more than a century, been known to the European residents in the fur countries as the "Horned Wavy"—the last word being a rendering of a native name, *Wawa*, which signifies Goose. Finally, there appears to belong to this section, though it has been frequently referred to another (*Chloephaga*), and has also been made the type of a distinct genus (*Phalacrocorax*), the beautiful Painted Goose, *C. canagica*, which is almost peculiar to the Aleutian Islands, though straying to the continent in winter, and may be recognized by the white edging of its remiges.

The southern portions of the New World are inhabited by about half a dozen species of Geese, akin to the foregoing, but separated as the genus *Chloephaga*. The most noticeable of them are the Rock or Kelp Goose, *C. antarctica*, and the Upland Goose, *C. magellanica*. In both of these the sexes are totally unlike in colour, the male being nearly white, while the female is of a mottled brown, but in others a greater similarity obtains.<sup>1</sup> Very nearly allied to the birds of this group, if indeed that can be justifiably separated, comes one which belongs to the northern hemisphere, and is common to the Old World as well as the New. It contains the Geese which have received the common names of Bernacles or Brents,<sup>2</sup> and the scientific appellations of *Bernicla* and *Branta*—for the use of either of which much may be said by nomenclaturists. All the species of this section are distinguished by their general dark sooty colour, relieved in some by white of greater or less purity, and by way of distinction from the members of the genus *Anser*, which are known as Grey Geese, are frequently called by fowlers Black Geese. Of these, the best known both in Europe and North America is the Brent-Goose—the *Anas bernicla* of Linnæus, and the *B. torquata* of many modern writers—a truly marine bird, seldom (in Europe at least) quitting salt-water, and coming southward in vast flocks towards autumn, frequenting bays and estuaries on our coasts, where it lives chiefly on sea-grass (*Zostera maritima*). It is known to breed in Spitsbergen and in Greenland. A form which is by some ornithologists deemed a good species, and called by them *B. nigricans*, occurs chiefly on the Pacific coast of North America. In it the black of the neck, which in the common Brent terminates just above the breast, extends over most of the lower parts. The true Bernacle-Goose,<sup>3</sup> the *B. leucopsis* of most authors, is but a casual visitor to

North America, but is said to breed in Iceland, and occasionally in Norway. Its usual *incunabula*, however, still form one of the puzzles of the ornithologist, and the difficulty is not lessened by the fact that it will breed freely in semi-captivity, while the Brent-Goose will not. From the latter the Bernacle-Goose is easily distinguished by its larger size and white cheeks. Hutchins's Goose (*B. Hutchinsi*) seems to be its true representative in the New World. In this the face is dark, but a white crescentic or triangular patch extends from the throat on either side upwards behind the eye. Almost exactly similar in coloration to the last, but greatly superior in size, and possessing 18 rectrices, while all the foregoing have but 16, is the common wild Goose of America, *B. canadensis*, which, for some two centuries or more, has been introduced into Europe, where it propagates so freely that it has been included by nearly all the ornithologists of this quarter of the globe, as a member of its fauna. An allied form, by some deemed a species, is *B. leucopareia*, which ranges over the western part of North America, and, though having 18 rectrices, is distinguished by a white collar round the lower part of the neck. The most diverse species of this group, of Geese are the beautiful *B. ruficollis*, a native of North eastern Asia, which occasionally strays to Western Europe, and has been obtained more than once in Britain, and that which is peculiar to the Hawaiian archipelago, *B. sandvicensis*.

The largest living Goose is that called the Chinese, Guinea, or Swan-Goose, *Cygnopsis cygnoides*, and it seems to be the stock whence the domestic Geese of several Eastern countries have sprung. It may not unfrequently be seen in English farmyards, and it is found to cross readily with our common tame Goose, the offspring being fertile, and Blyth has said that these crosses are very abundant in India. The true home of the species is in Eastern Siberia or Mongolia. It is distinguished by its upright bearing, which has been well rendered by Bewick's excellent figure. The Ganders of the reclaimed form are distinguished by the knob at the base of the bill, but the evidence of many observers shows that this is not found in the wild race. Of this bird there is a perfectly white breed.

We have next to mention a very curious form, *Cereopsis nove-hollandiæ*, which is peculiar to Australia, and appears to be a more terrestrial type of Goose than any other now existing. Its short, decurved bill and green cere give it a very peculiar expression, and its almost uniform grey plumage, bearing rounded black spots, is also remarkable. It bears captivity well, breeding in confinement, and may be seen in many parks and gardens. It appears to have been formerly very abundant in many parts of Australia, from which it has of late been exterminated. Some of its peculiarities seem to have been still more exaggerated in a bird that is wholly extinct, the *Cnemidornis calcitrans* of New Zealand, the remains of which were described in full by Professor Owen in 1873 (*Trans. Zool. Society*, ix. p. 253). Among the first portions of this singular bird that were found were the *tibiae*, presenting an extraordinary development of the *patella*, which, united with the shank-bone, gave rise to the generic name applied. For some time the affinity of the owner of this wonderful structure was in doubt, but all hesitation was dispelled by the discovery of a nearly perfect skeleton, now in the British Museum, which proved the bird to be a Goose, of great size, and unable, from the shortness of its wings, to fly.

<sup>1</sup> See Selater and Salvin, *Proc. Zool. Society*, 1876, pp. 361-369.

<sup>2</sup> The etymology of these two words is exceedingly obscure, and no useful purpose could be attained by discussing it here, especially as any disquisition upon it must needs be long. Suffice it to say that the ordinary spelling Bernicle seems to be wrong, if we may judge from the analogy of the French *Bernache*. In both words the *e* should be sounded as *a*.

<sup>3</sup> The old fable, perhaps still believed by the uneducated in some parts of the world, of Bernacle-Geese being produced from the Bernacles (*Lepadidæ*) that grow on timber exposed to salt-water, is not more absurd than many that in darker ages had a great hold of the popular mind, and far less contemptible than the conceited spirit in which many modern zoologists and botanists often treat it. They

should remember that the doctrine of spontaneous generation has still many adherents, and that seems to be hardly less extravagant than the notion of birds growing from "worms," as they were then called. The mistake of our forefathers is of course evident, but that is no reason for deriding their innocent ignorance as some of our contemporaries are fond of doing.

In correlation with this loss of power may also be noted the dwindling of the keel of the sternum. Generally, however, its osteological characters point to an affinity to *Cereopsis*, as was noticed by Dr Hector (*Trans. New Zeal. Institute*, vi. pp. 76-84), who first determined its Anserine character.

Birds of the genera *Chenalopez* (the Egyptian and Orinoco Geese), *Plectropterus*, *Sarcidiornis*, *Chlamydochen*, and some others, are commonly called Geese. To the writer it seems uncertain whether they should be grouped with the *Anserinæ*. The males of all appear to have that curious enlargement at the junction of the bronchial tubes and the trachea which is so characteristic of the Ducks or *Anatinæ*. As much may be said for the genus *Nettapus*, but want of space precludes further consideration of the subject here. (A. N.)

GOOSEBERRY, *Ribes grossularia*, a well-known fruit-bush of northern and central Europe, usually placed in the same genus of the natural order to which it gives name as the closely allied currants, but by some made the type of a small sub-genus, *Grossularia*, the members of which differ from the true currants chiefly in their spinous stems, and in their flowers growing on short footstalks, solitary, or two or three together, instead of in racemes.

The wild gooseberry is a small, straggling bush, nearly resembling the cultivated plant,—the branches being thickly set with sharp spines, standing out singly or in diverging tufts of two or three from the bases of the short spurs or lateral leaf shoots, on which the bell-shaped flowers are produced, singly or in pairs, from the groups of rounded, deeply-crenated 3 or 5-lobed leaves. The fruit is smaller than in the garden kinds, but is often of good flavour; it is generally hairy, but in one variety smooth, constituting the *R. uva-crispa* of writers; the colour is usually green, but plants are occasionally met with having deep purple berries. The gooseberry is indigenous to the central parts of Europe and western Asia, growing naturally in alpine thickets and rocky woods in the lower country, from France eastward, perhaps as far as the Himalaya. In Britain it is often found in copses and hedgerows and about old ruins, but has been so long a plant of cultivation that it is difficult to decide upon its claim to a place in the native flora of the island. Common as it is now on some of the lower slopes of the Alps of Piedmont and Savoy, it is uncertain whether the Romans were acquainted with the gooseberry, though it may possibly be alluded to in a vague passage of Pliny: the hot summers of Italy, in ancient times as at present, would be unfavourable to its cultivation. Abundant in Germany and France, it does not appear to have been much grown there in the Middle Ages, though the wild fruit was held in some esteem medicinally for the cooling properties of its acid juice in fevers; while the old English name, *Few-berry*, still surviving in some provincial dialects, indicates that it was similarly valued in Britain, where it was planted in gardens at a comparatively early period. Turner describes the gooseberry in his *Herball*, written about the middle of the 16th century, and a few years later it is mentioned in one of Tusser's quaint rhymes as an ordinary object of garden culture. Improved varieties were probably first raised by the skilful gardeners of Holland, whose name for the fruit, *Kruisbezie*, may have been easily corrupted into the present English vernacular word.<sup>1</sup> Towards the end of the last century the gooseberry became a favourite object of cottage-horticulture, especially in Lancashire, where the working cotton-spinners have raised numerous varieties from seed, their efforts having been chiefly directed to increasing the size of the fruit.

<sup>1</sup> The Scotch *grossart*, originally *grosel*, evidently from the French *grosseille*, may have the same ultimate origin; the usual derivation from *grossus*, a green fig, seems far-fetched. The rough wild fruit is called by the Germans *krausbeere*.

Of the many hundred sorts enumerated in recent horticultural works, few perhaps equal in flavour some of the older denizens of the fruit-garden, such as the "old rough red" and "hairy amber." The climate of the British Islands seems peculiarly adapted to bring the gooseberry to perfection, and it may be grown successfully even in the most northern parts of Scotland; indeed, the flavour of the fruit is said to improve with increasing latitude. In Norway even, the bush flourishes, in gardens on the west coast, nearly up to the Arctic circle, and it is found wild as far north as 63°. The dry summers of the French and German plains are less suited to it, though it is grown in some hilly districts with tolerable success. The gooseberry in the south of England will grow well in cool situations, and may be sometimes seen in gardens near London flourishing under the partial shade of apple trees; but in the north it needs full exposure to the sun to bring the fruit to perfection. It will succeed in almost any soil, but prefers a rich loam or black alluvium, and, though naturally a plant of rather dry places, will do well in moist land, if drained.

The varieties are most easily propagated by cuttings planted in the autumn, which root rapidly, and in a few years form good fruit-bearing bushes. Much difference of opinion prevails regarding the mode of pruning this valuable shrub; it is probable that in different situations it may require varying treatment. The fruit being borne on the lateral spurs, and on the shoots of the last year, it is the usual practice to shorten the side branches in the winter, before the buds begin to expand; some reduce the longer leading shoots at the same time, while others prefer to nip off the ends of these in the summer while they are still succulent. When large fruit is desired, plenty of manure should be supplied to the roots, and the greater portion of the berries picked off while still small. Burridge states that the gooseberry may be with advantage grafted or budded on stocks of some other species of *Ribes*, *R. aureum*, the ornamental golden currant of the flower garden, answering well for the purpose. The giant gooseberries of the Lancashire "fanciers" are obtained by the careful culture of varieties specially raised with this object, the growth being encouraged by abundant manuring, and the removal of all but a very few berries from each plant. Single gooseberries of nearly 2 ounces in weight have been occasionally exhibited; but the produce of such fanciful horticulture is generally insipid. The bushes at times suffer much from the ravages of the caterpillar of the gooseberry or magpie moth, *Abraxas grossulariata*, which often strip the branches of leaves in the early summer, if not destroyed before the mischief is accomplished. The most effectual way of getting rid of this pretty but destructive insect is to look over each bush carefully, and pick off the larvæ by hand; when larger they may be shaken off by striking the branches, but by that time the harm is generally done—the eggs are laid on the leaves of the previous season. Equally annoying in some years is the smaller larva of the V-moth, *Halias vanaria*, which often appears in great numbers, and is not so readily removed. The gooseberry is sometimes attacked by the grub of a fly, *Nematus ribesii*, of which several broods appear in the course of the spring and summer, and are very destructive. The grubs bury themselves in the ground to pass into the pupal state; the first brood of flies, hatched just as the bushes are coming into leaf in the spring, lay their eggs on the lower side of the leaves, where the small greenish larvæ soon after emerge. For the destruction of the first broods it has been recommended to syringe the bushes with tar-water; perhaps a very weak solution of carbolic acid might prove more effective. The powdered root of white hellebore is said to destroy both this grub and the caterpillars

of the gooseberry and V-moth; infusion of foxglove, and tobacco-water, are likewise tried by some growers. If the fallen leaves are carefully removed from the ground in the autumn and burnt, and the surface of the soil turned over with the fork or spade, most eggs and chrysalids will be destroyed.

The gooseberry was introduced into the United States by the early settlers, and in some parts of New England large quantities of the green fruit are produced and sold for culinary use in the towns; but the excessive heat of the American summer is not adapted for the healthy maturation of the berries, especially of the English varieties. Perhaps if some of these, or those raised in the country, could be crossed with one of the indigenous species, kinds might be obtained better fitted for American conditions of culture, although the gooseberry does not readily hybridize. The bushes are apt to be infested by a minute fly, known as the gooseberry midge, *Cecidomyia grossulariæ*, which lays its eggs in the green fruit, in which the larvæ are hatched, causing the berries to turn purple and fall prematurely. According to Mr Fitch, the midge attacks the wild native species as well as the cultivated gooseberry.

The gooseberry, when ripe, yields a fine wine by the fermentation of the juice with water and sugar, the resulting sparkling liquor retaining much of the flavour of the fruit. By similarly treating the juice of the green fruit, picked just before it ripens, an effervescing wine is produced, nearly resembling some kinds of champagne, and, when skilfully prepared, far superior to much of the liquor sold under that name. Brandy has been made from ripe gooseberries by distillation; by exposing the juice with sugar to the acetous fermentation a good vinegar may be obtained. The gooseberry, when perfectly ripe, contains a large quantity of sugar, most abundant in the red and amber varieties; in the former it amounts to from 6 to upwards of 8 per cent. The acidity of the fruit is chiefly due to malic acid.

Several other species of the sub-genus produce edible fruit, though none have as yet been brought under economic culture. Among them may be noticed *R. oxyacanthoides* and *R. cynosbati*, abundant in Canada and the northern parts of the United States, and *R. gracile*, common along the Alleghany range. The group is a widely distributed one, species occurring to the west of the Rocky Mountains, and in Siberia and Japan, while one is said to have been found by recent explorers on the lofty Kilimanjaro, near the lake-sources of the Nile. (C. P. J.)

**GOPHER** (*Testudo gopher*, Bartr.), the only living representative on the North American continent of the *Testudinidae* or family of land tortoises, where it occurs in the south-eastern parts of the United States, from Florida in the south to the river Savannah in the north. Its carapace, which is oblong and remarkably compressed, measures from 13 to 14 inches in extreme length, the shields which cover it being grooved, and of a yellow-brown colour. The gopher abounds chiefly in the forests, but occasionally visits the open plains, where it does great damage, especially to the potato crops, on which it feeds. It is a nocturnal animal, remaining concealed by day in its deep burrow, and coming forth at night to feed. Its strength in proportion to its size is said to be enormous, it being able, according to Dumeril and Bibron, to move along comfortably bearing a man on its back. The flesh of the gopher or mungofa, as it is also called, is considered excellent eating.

**GÖPPINGEN**, a town of Würtemberg, circle of the Danube, on the right bank of the Fils, 22 miles E.S.E. of Stuttgart. It possesses an old castle erected by Duke Christopher in the 16th century, two evangelical churches, a Roman Catholic chapel, a synagogue, a real school, a classical school, and an advanced school. The manufactures

include linen and woollen cloth, leather, glue, paper, machines, and toys. Three miles north of the town are the ruins of the old castle of Hohenstaufen, with the Barbarossa chapel, containing, besides other adornments, an old fresco of Frederick Barbarossa dating probably from the 16th century. Göppingen originally belonged to the house of Hohenstaufen, and at a later period came into the possession of the counts of Würtemberg. It was surrounded by walls in 1129. The population in 1875 was 9532.

**GORAKHPUR**, a district of the North-Western Provinces, India, between 26° 50' 15" and 27° 28' 48" N. lat., and between 83° 7' and 84° 29' E. long., bounded on the N. by the territory of Nepal, on the E. by Champaran and Saran, on the S. by the Gogra river, and on the W. by Basti and Fyzabad, with an area of 4578 square miles. The district lies immediately south of the lower Himalayan slopes, but forms itself a portion of the great alluvial plain. Only a few sandhills break the monotony of its level surface, which is, however, intersected by numerous rivers studded with lakes and marshes. In the north and centre dense forests abound, and the whole country has a verdant appearance. The principal rivers are the Rápti, the Gogra, the great and little Gandak, the Kuána, the Rolim, the Ami, and the Gunghi. The tiger is found in the north, and many other wild animals abound throughout the district. The lakes are well stocked with fish.

The population, which in 1853 numbered 1,816,390, had risen to 2,019,361 in 1872, a great increase in so short a period; of these, 1,819,445 or 90·1 per cent. are Hindus, 199,372 Mussulmans, and 533 Christians. The district contains a total cultivated area of 2621 square miles, with 897 square miles available for cultivation, most of which is now under forest. The chief products are cotton, rice, *bajra*, *jowar*, *moth*, and other food-stuffs. The commerce of Gorakhpur is confined to the above products. The means of communication are still imperfect. Two good metalled roads run through the district, one from Gorakhpur to Benares *via* Barhalganj, the other to Basti and Fyzabad. The total revenue in 1876 was £227,738. The police force in 1875 numbered 755 officers and men. In 1875 there were 435 schools, with 13,525 pupils. The district is not subject to very intense heat, from which it is secured by its vicinity to the hills and the moisture of its soil. Dust-storms are rare, and cool breezes from the south, rushing down the gorges of the Himalayas, succeed each short interval of warm weather. The climate is, however, relaxing. The southern and eastern portions are as healthy as most parts of the province, but the *tárai* and forest-tracts are still subject to malaria. The average rainfall from 1860 to 1871 was 45·8 inches; the maximum was 60 inches in 1861, and the minimum 25 inches in 1868. The mean monthly temperature in the shade was 77° in 1870, and 76° in 1871. The death rate in 1875 was 40·092, or 19·85 per thousand of the population.

Gautama Buddha, the founder of the religion bearing his name, died within the district of Gorakhpur. It thus became the headquarters of the new creed, and was one of the first tracts to receive it. The country from the beginning of the 6th century was the scene of a continuous struggle between the Bhars and their Aryan antagonists, the Rahtors. About 900 the Domhatárs or military Bráhmans appeared, and expelled the Rahtors from the town of Gorakhpur, but they also were soon driven back by other invaders. During the 15th and 16th centuries, after the district had been desolated by incessant war, the descendants of the various conquerors held parts of the territory, and each seems to have lived quite isolated, as no bridges or roads attest any intercourse with each other. Towards the end of the 16th century, Mussulmans occupied Gorakhpur town, but they interfered very little with the district, and allowed it to be controlled by the native rájás. In the middle of the 18th century a formidable foe, the Banjárs from the west, kept the district in a state of terror, and so weakened the power of the rájás that they could not resist the fiscal exactions of the Oudh officials, who plundered and ravaged the country to a great extent. The district formed part of the territory ceded by Oudh to the British under the treaty of 1801. During the mutiny it was lost for a short time, but under the friendly Gurkhás the rebels were driven out, and the whole district once more passed under British rule.

**GORAKHPUR**, a municipal city, and the administrative headquarters of Gorakhpur district, North-Western Provinces, in 26° 44' 8" N. lat., and 83° 23' 44" E. long., on the river Rápti, near the centre of the district. It was

founded about 1400, on the site of a more ancient city. It is the headquarters of a civil and sessions judge, with the usual administrative offices, and has a considerable trade in grain and timber sent down the Rápti to the Gogra and the Ganges. The municipal revenue in 1875-76 was £4771. Population (1872), 51,117.

GORAMY, or GOURAMY (*Osphronemus olfax*), is reputed to be one of the best-flavoured freshwater fishes in the East Indian archipelago. Its original home is Java, Sumatra, Borneo, and several other East Indian islands, but thence it has been transported to and acclimatized in Penang, Malacca, Mauritius, and even Cayenne. Being

Goramy.

an almost omnivorous fish and tenacious of life, it seems to recommend itself particularly for acclimatization in other tropical countries; and specimens kept in captivity become as tame as carps. It attains the size of a large turbot. Its shape is flat and short, the body covered with large scales; the dorsal and anal fins are provided with numerous spines, and the ventral fins produced into long filaments.

GORCUM, or GORKUM (Dutch, *Gorinchem*), a town of the Netherlands, chief town of a circle in the province of South Holland, 22 miles E.S.E. of Rotterdam, on the right bank of the Merve or Merwede, at the influx of the Linge, by which it is intersected. It is surrounded by walls, and has an old town-house adorned with fine old paintings, a prison, a custom-house, barracks, an arsenal, and a military hospital. The old church of St Vincent contains the monuments of the lords of Arkel. The charitable and benevolent institutions are numerous, and there are also a library and several learned associations. Gorcum possesses a good harbour, and carries on a considerable trade in grain, hemp, cheese, potatoes, and fish, although it is still destitute of railway communication. The population in 1876 was 9301.

The earliest notice of Gorcum is in a document of John I., duke of Brabant (in the close of the 13th century), granting the town's folk free trade throughout his duchy. The history in the 15th century is closely connected with that of the countship of Arkel. It was within its walls that William, the last lord of Arkel, perished in 1417, on the capture of the town by the Kabeljaus; and it was the burghers of Gorcum who in 1573 laid the castle of Arkel in ruins. In 1572, when the town was taken by William de la Marck, he put to death 19 priests and friars, who have a place in the Romish calendar as the Martyrs of Gorcum. The place defended itself successfully against the French in 1672, but was taken by the Prussians in 1785, by the French in 1795, and by the allies in 1814.

GORDIANUS, or GORDIAN, the name of three Roman emperors. The first, Marcus Antonius Africanus Gordianus, the wealthiest of the Romans, was descended on the father's side from the Gracchi, on the mother's from Trajan, while his wife was the granddaughter of Antoninus Pius. While he gained unbounded popularity by his magnificent games and shows, his prudent and retired life did not alarm the tyranny of Caracalla. Alexander Severus called him to the dangerous honours of government in Africa; and during his proconsulship there occurred the usurpation of Maximin. The universal discontent roused by the oppressive rule of Maximin culminated in a revolt in Africa in 238, and Gordian reluctantly yielded to the

popular clamour and assumed the purple. His son was associated with him in the dignity. The senate confirmed the choice of the Africans, and most of the provinces gladly sided with the new emperors; but, even while their cause was so successful abroad, they had fallen before the sudden inroad of Capellianus, who commanded Mauretania in the interest of Maximin. They had reigned only 36 days. Both the Gordians had deserved by their amiable character their high reputation; they were men of great accomplishments, fond of literature, and voluminous authors; but they were rather intellectual voluptuaries than able statesmen or powerful rulers. Having embraced the cause of Gordian, the senate was obliged to continue the revolt against Maximin, and appointed Maximus and Balbinus, two of its noblest and most esteemed members, as joint emperors. At their inauguration a sedition arose, and the popular outcry for a Gordian was appeased by the association of M. Antonius Gordianus Pius, nephew of the younger and grandson of the elder Gordian, a boy of thirteen. Maximin forthwith invaded Italy, but was murdered by his own troops while besieging Aquileia; and a revolt of the prætorian guards, to which Maximus and Balbinus fell victims, left Gordian sole emperor. For some years he was under the control of his mother's eunuchs, till happily Misisheus, his teacher of rhetoric, whose daughter he married, roused him to free himself from the ignoble tyranny. Misisheus was appointed prefect of the prætorian guards, and wielded ably the supreme power that now belonged to him. When the Persians invaded Mesopotamia, the young emperor at his persuasion opened, for the last time recorded in history, the temple of Janus, and marched in person to the East. Misisheus proved a skilful and prudent general; but his sudden death under strong suspicions of poisoning was the end of Gordian's prosperity. Discontent and seditions, fostered by Philip, who had succeeded Misisheus, arose in the camp, and Gordian was slain by the mutinous soldiers (244). A monument near the confluence of the Euphrates and Aboras marked the scene.

GORDIUM, an ancient town of Bithynia, was situated not far from the river Sangarius, but the site has not been exactly ascertained, though M. Lejean believes that it may be identified with ruins which he observed in the vicinity of the village Emret. It was undoubtedly a place of high antiquity, and though Strabo describes it as a village, it afterwards increased in size, and, under the name of Juliopolis, which it received in the reign of Augustus, it continued to flourish to the time of Justinian at least. According to the legend, Gordium was founded by a certain Gordius, who had been called to the throne by the Phrygians in obedience to an oracle of Zeus commanding them to select the first person that rode into the agora in a car. The king afterwards dedicated his car to the god, and another oracle declared that whoever succeeded in untying the strangely entwined knot of the yoke should reign over all Asia. Alexander the Great, according to the well-known story, overcame the difficulty of the Gordian knot by a stroke of his sword.

See Kiepert, *Beitrage zur inschriftlichen Topographie Klein-Asiens*, 1863; Lejean, in *Bull. de la Soc. de Géogr.*, Paris, 1869.

GORDON, ALEXANDER, the "Sandy Gordon" of Scott's *Antiquary*, is believed to have been a native of Aberdeen, and a graduate of either King's or Marischal College, but of his parentage and early history nothing is known. When still a young man he is said to have travelled abroad, probably in the capacity of tutor. He must, however, have returned to Scotland previous to 1726, when, betaking himself to antiquarian pursuits, he made the acquaintance of, among others, Roger Gale, the first vice-president of the Society of Antiquaries. In the year just

mentioned appeared the *Itinerarium Septentrionale*, his greatest and best known work. He was already the friend of Sir John Clerk, of Penicuik, better known as Baron Clerk, from his having been appointed one of the Barons of the Exchequer; and the Baron and Roger Gale are the "two gentlemen, the honour of their age and country," whose letters were published, without their consent it appears, as an appendix to the *Itinerarium*. Subsequently Gordon was appointed secretary to the Society for the Encouragement of Learning, with an annual salary of £50. Resigning this post he succeeded Dr Stukeley as secretary to the Society of Antiquaries, and also acted for a short time as secretary to the Egyptian Club, an association composed of gentlemen who had visited Egypt. In 1741 he accompanied Governor Glen to South Carolina. No explanation has yet been given of the reasons which led to this step, or of the relations between the old "Roman" antiquary and his new patron. A hint, but nothing more, is afforded by the fact that in the list of subscribers to the *Itinerarium* we find the name of "James Glen of Longcroft, Esq." Through the influence probably of his friend, Gordon, besides receiving a grant of land in Carolina, was appointed registrar of the province, and justice of the peace, and filled several other offices. From his will, still in existence, dated 22d August 1754, we learn that he had a son Alexander and a daughter Frances, to whom he bequeathed most of his property, among which were portraits of himself and of friends painted by his own hand.

Some additional particulars regarding Gordon and his works may be got from a communication to the Society of Antiquaries of Scotland by Professor Daniel Wilson, LL.D., Toronto, printed in the *Proceedings*, with Additional Notes and an Appendix of Original Letters by the late Dr David Laing (*Proc. Soc. of Antiq. of Scot.*, vol. x. pp. 363-382).

GORDON, LORD GEORGE, (1751-1793), third and youngest son of Cosmo George, duke of Gordon, was born in London 26th December 1751. After completing his education at Eton, he entered the navy, where he rose to the rank of lieutenant; but on account of a disagreement regarding promotion with Lord Sandwich, then at the head of the admiralty, he resigned his commission shortly before the commencement of the American war. In 1774 he entered parliament as member for the small borough of Luggershall, and possessing some wit, great ease of address, and the confidence arising from sincere conviction, he advocated his individual notions on any subject with great volubility and with something of the eagerness of monomania. After supporting the ministry for some time, he began to attack both ministry and opposition with such ceaseless pertinacity that it became a common saying that "there were three parties in parliament, the ministry, the opposition, and Lord George Gordon." He vehemently opposed the passing of the Acts for the removal of the Roman Catholic disabilities, and took a leading part in organizing the Protestant associations of Scotland and England. Of both associations he was chosen president, and on June 2d 1780 he headed the mob which marched in procession from St George's Fields to the Houses of Parliament in order to present the monster petition against the Acts. After the mob reached Westminster a terrific riot ensued, which continued several days, during which the city was virtually at their mercy. At first indeed they dispersed after threatening to make a forcible entry into the House of Commons, but reassembled soon afterwards and destroyed several Roman Catholic chapels, pillaged the private dwellings of many Roman Catholics, set fire to Newgate and broke open all the other prisons, attacked the Bank of England and several other public buildings, and continued the work of violence and conflagration until the interference of the military, by whom no fewer than 450 persons were killed and wounded

before the riots were quelled. For his share in instigating the riots Lord Gordon was apprehended on a charge of high treason; but, mainly through the skilful and eloquent defence of Erskine, he was acquitted on the ground that he had no treasonable intentions. In 1786 he was excommunicated by the archbishop of Canterbury for refusing to bear witness in an ecclesiastical suit; and in 1787 he was convicted of libelling the queen of France, the French ambassador, and the administration of justice in England. He was, however, permitted to withdraw from the court without bail, and made his escape to Holland; but on account of representations from the court of Versailles he was commanded to quit that country, and, returning to England, was apprehended, and in January 1788 was sentenced to five years' imprisonment in Newgate, where, after refusing to grant the guarantees required as a condition of his obtaining his liberty at the conclusion of his original term of imprisonment, he died of delirious fever November 1, 1793. Some time before his apprehension he had become a convert to Judaism, and had undergone the initiatory rite. A serious defence of most of his eccentricities is undertaken in *The Life of Lord George Gordon, with a Philosophical Review of his Political Conduct*, by Robert Watson, M.D., London, 1795.

GORDON, SIR JOHN WATSON (1788-1864), Scottish painter, was the eldest son of Captain Watson, R.N., a cadet of the family of Watson of Overmains, in the county of Berwick. He was born in Edinburgh in 1788, and, it being his father's desire that he should enter the army, was educated specially with a view to his joining the Royal Engineers. As drawing was even at that period considered a not inappropriate accomplishment for the scientific service, he was, while waiting for his commission, entered as a student in the Government school of design, then as now under the management of the Board of Manufactures. With the opportunity, his natural taste for art quickly developed itself, and his industry and progress were such that his father was persuaded to allow him to adopt it as his profession. Captain Watson was himself a skilful draughtsman, and his brother George Watson, afterwards president of the Scottish Academy, stood high as a portrait painter, second only to Sir Henry Raeburn, who also was a friend of the family. Between the studios of his uncle and his friend, John Watson seems to have thought he had every necessary assistance a young artist required, and neither then nor at a future period showed any desire for foreign study; his art consequently is more purely of native growth than that of any of his contemporaries. In the year 1808 he sent to the exhibition of the Lyceum in Nicolson Street a subject from the *Lay of the Last Minstrel*, and continued for some years to exhibit fancy subjects; but, although freely and sweetly painted, they were altogether without the force and character which in his own proper walk stamped his portrait pictures as the works of a master. After the death of Sir Henry Raeburn in 1823, he succeeded to much of his practice; and as there were at that time in Edinburgh four artists of the name of Watson, all of them portrait painters, he assumed in 1826 the name of Gordon, by which he is best known. Mixing a good deal in literary and scientific society, he painted most of the notabilities who lived in or visited the northern metropolis during his career; one of the earliest of his famous sitters was Sir Walter Scott, who sat for a first portrait in 1820. Then came J. G. Lockhart in 1821; Professor Wilson, 1822 and 1850, two portraits; Sir Archibald Alison, 1839; Dr Chalmers, 1844; a little later De Quincey; and Sir David Brewster, 1864, being the last picture he painted. Among his most important works may be mentioned the earl of Dalhousie, 1833, now in the Archers' Hall, Edinburgh; Sir Alexander Hope, 1835, in the county buildings,

Linlithgow; Lord President Hope, in the Parliament House; and Dr Chalmers, 1844. These are all full lengths, and were exhibited in London, where they attracted great attention (the Chalmers portrait was purchased some years later by Sir Robert Peel, and is now in the Peel Gallery); they belong to his middle period, and are distinguished by great sweetness in execution, and, unlike his later works, are generally rich in colour. The full length of Dr Brunton, 1844, and Dr Lee, the principal of the university, 1846, both in the staircase of the College Library, mark a modification of his style, which ultimately resolved itself into extreme simplicity, both of colour and treatment.

During the last twenty years of his life he painted many distinguished Englishmen who came to Edinburgh to sit to him. And it is significant of the position he held in the esteem of artists themselves that David Cox, the landscape painter, on being presented with his portrait, subscribed for by many friends, chose to go to Edinburgh to have it executed by Watson Gordon, although he neither knew the painter personally nor had ever before visited the country. Among the portraits painted during this period, in what may be termed his third style, are De Quincey, the opium eater, in the National Portrait Gallery, London; General Sir Thomas Macdougall Brisbane, in the Royal Society; the prince of Wales, Lord Macaulay, Sir M. Packington, Lord Murray, Lord Cockburn, Lord Rutherford, and Sir John Shaw Lefevre, in the Scottish National Gallery, and a host of others, for latterly he not only possessed great facility of brush but was industrious to a fault. These latter pictures are mostly clear and grey, sometimes showing little or no positive colour, the flesh itself being very grey, and the handling extremely masterly, though never obtruding its cleverness. He was very successful in rendering acute observant character, and there is a look of mobility of feature, in repose it is true, but suggesting that the eye could twinkle and the lips relax. As an example of his last style, showing pearly flesh painting freely handled, yet highly finished, the head of Sir John Shaw Lefevre will hold its own in any school.

John Watson Gordon was one of the earlier members of the Royal Scottish Academy, and was elected its president in 1850; he was at the same time appointed limner to her majesty for Scotland, and received the honour of knighthood. Since 1841 he had been an associate of the Royal Academy, and in 1851 he was elected a Royal Academician. Sir John continued to paint with little if any diminution of power until within a very few weeks of his death, which occurred on the 1st of June 1864.

GORDON, PATRICK (1635–1699), of Auchleuchries, a Russian general, was descended from a Scotch family of Aberdeenshire, who possessed the small estate of Auchleuchries, and were connected with the house of Haddo. He was born in 1635, and after completing his education at the parish schools of Cruden and Ellon, entered, in his fifteenth year, the Jesuit college at Braunsberg, Prussia; but, as “his humour could not endure such a still and strict way of living,” he soon resolved to return home. He changed his mind, however, before re-embarking, and after journeying on foot in several parts of Germany, ultimately, in 1655, enlisted at Hamburg in the Swedish service. In the course of the next five years he served alternately with the Poles and Swedes as he was taken prisoner by either. In 1661, after changing his resolution more than once, he took service in the Russian army under Alexis I., and in 1666 he was sent on a special mission to England. After his return he distinguished himself in several wars against the Turks and Tartars in southern Russia, and in recognition of his services he in 1678 was made major-general, in 1679 was appointed to the chief command at Kieff, and in 1683 was made lieutenant-general. He visited England in 1686, and, after

his return to Russia, he in 1687 and 1689 took part as quartermaster-general in the expeditions against the Crimean Tartars in the Crimea. On the breaking out of the revolution in Moscow in the latter year, Gordon with the troops he commanded virtually decided events in favour of the czar Peter I., and against the czarina Sophia. He was therefore during the remainder of his life in high favour with the czar, who confided to him the command of his capital during his absence from Russia, employed him in organizing his army according to the European system, and latterly raised him to the rank of general-in-chief. He died November 29, 1699. The czar, who had visited him frequently during his illness, was with him when he died, and with his own hands closed his eyes.

General Gordon left behind him a diary of his life, written in English. Several of those parts of the diary connected with the military history of Russia were at an early period translated into German—then the literary language of St Petersburg—but never printed, although made use of for various other works. A complete German translation, by Prince M. A. Kolenski and Mr M. C. Powell, was published, the first volume at Moscow in 1849, the second at St Petersburg in 1851, and the third at St Petersburg in 1858; and *Passages from the Diary of General Patrick Gordon of Auchleuchries, 1635–1699*, was printed, under the editorship of Joseph Robertson, for the Spalding Club, Aberdeen, 1859.

GORE, MRS CATHERINE GRACE (1799–1861), an exceedingly prolific English novelist, was born in 1799 at East Retford, Nottinghamshire, and was the daughter of Mr Moody, a wine-merchant. In 1823 she was married to Captain Charles Gore; and, in the same year, she published her first work, *Theresa Marchmont, or the Maid of Honour*. Then followed, in rapid succession, the *Lettre de Cachet* and *The Reign of Terror* (1827), *Hungarian Tales*, *Manners of the Day* (1830), *Mothers and Daughters* (1831), and *The Fair of May Fair* (1832). At this point the critics began to say that Mrs Gore had written enough; and she accordingly went to France to extend her range of observation, and did not publish till 1836, when her next novel, entitled *Mrs Armitage*, appeared. Every succeeding year saw several volumes from her pen; and in 1839 *The Cabinet Minister*, *Preferment*, and *The Courtier of the Days of Charles II.* were issued from the press. But in 1841 Mrs Gore fairly eclipsed her other novels by the publication of *Cecil, or the Adventures of a Coxcomb*, which produced a great sensation. This year also appeared *Greville, or a Season in Paris*. Then followed, in 1842, *Ormington, or Cecil a Peer*, *Fascination*, and *The Ambassador's Wife*; and in 1843 Mrs Gore produced another masterpiece, entitled *The Banker's Wife*. She continued to write, with unfailing fertility of invention, till her death in January 1861. Mrs Gore also published some dramas and translations from the French; but it is as a fashionable novelist that she is remembered. Her life was one of extraordinary literary industry, as may be inferred from the fact that she is the author of more than seventy distinct works. Among her best novels are *Cecil, or the Adventures of a Coxcomb*, *Greville*, and *The Banker's Wife*. *Cecil* gives extremely vivid sketches of London fashionable life, and is full of happy epigrammatic touches. It displays great knowledge of London clubs, for which Mrs Gore was indebted to Mr Beckford, the author of *Vathek*. The narrative is varied by occasional glimpses of Continental life. *Greville* is marked by faithful pictures of English country life, and of the ease and grace of French society. *The Banker's Wife* is distinguished for masterly studies of character, especially in the persons of Mr Hamlyn, the cold calculating money-maker, and his warm-hearted country neighbour, Colonel Hamilton.

Mrs Gore's works are characterized by great cleverness in invention, lively satire, shrewd insight into character, and keen observation of life. They are exceedingly deficient in feeling; and the lover of fiction passes a pleasant hour

or two over her novels, not much excited by the triumphs, or vexed by the sufferings of her characters. Sometimes her novels weary the reader; but this does not arise from any failing in her style, which is always clear, animated, and full of point, nor from lack of inventiveness, but from the endless repetitions involved in writing so many books on a subject of such comparatively limited range as fashionable life. Mrs Gore's novels have not only achieved an immense temporary popularity, but possess genuine historic value as eminently readable, and on the whole faithful, pictures of the life and pursuits of the English upper classes.

GORÉE (in French *Gorée*, and in the native tongue *Bir* or *Berr*, that is, a belly, in allusion to its shape), a small island off the west coast of Africa, belonging to the French colony of the Senegal. It lies immediately to the south of Cape Verd, and, according to the *Annuaire du Sénégal* for 1878, in 14° 39' 55" N. lat. and 12° 16' 40" W. long. The distance from the mainland in one direction is about 8 miles, and in another from 3 to 4. Though little more than a barren rock, Goree is of importance as a commercial and military post, and all the more as it has the advantage of a milder climate than the neighbouring mainland. The greater part of its area is occupied by the town, which was constituted a commune in 1872, and placed under the government of a municipal council of 14 members. The streets are narrow, and the houses, built for the most part of dark red stone, are flat-roofed. Among the principal buildings are the castle of St Michael, which occupies the rocky eminence in the south of the island, the governor's residence, the hospital, and the barracks. The summit of the rock within the citadel is levelled to an esplanade, and in the centre is a deep Artesian well, the only source in the otherwise arid island, which is dependent on its rain-water tanks for its ordinary supplies. Goree is a free port, and forms a convenient centre for the distribution of European goods. It is regularly visited by the vessels of the British and African Steam Navigation Company. The harbour is formed in a small sandy bay on the north-east side of the island. Telegraphic communication with St Louis dates from 1862. A chamber of commerce was established in 1870, and a sanitary commission in 1874. The town was reported in 1878 to have a population of 3243, and the arrondissement of Gorée-Dakar, of which it is the administrative centre, had a total population of 61,394. Dakar is a new settlement on the mainland, with a port constructed since 1857 for the vessels of the Messageries Maritimes; but with the exception of the public buildings the town has still to be built. Goree owes its name to the Dutch, who took possession of it in the beginning of the 17th century, and called it *Goeree* or *Goedereede*, in memory of the island on their own coast now united with *Overflakkee*. It was taken from them in 1663 by the English under Commodore Holmes, but recovered in the following year by De Ruyter. They were finally expelled, in 1677, by the French under Admiral D'Estrées, whose conquest was confirmed in 1678 by the peace of Nymwegen. In 1758 the island was captured for the English by Commodore Keppel, but a few years afterwards it was restored to France. With the exception of a few months in 1804, when the island was held by the French, the English were again in possession from 1800, when it was seized by Sir Charles Hamilton, till the peace of 1814.

GORGIAS of Leontini, in Sicily, a rhetorician and sophist of whose personal history nothing is known beyond the facts that in 427, when already a comparatively old man, he was sent by his fellow-citizens at the head of an embassy to ask Athenian protection against the aggression of the Syracusans; that he then settled in Athens, and supported himself by the practice of oratory and by teach-

ing rhetoric; and that he ended his days at Larissa, in Thessaly. His birth and death may be approximately dated respectively at 483 and 375 B.C. He was the author of a lost work *On Nature or the Non-existent* (*περὶ τοῦ μὴ ὄντος ἢ περὶ φύσεως*), the substance of which may be gathered from the writings of Sextus Empiricus, and also from the treatise (ascribed to Theophrastus) *De Melisso, Xenophane, Gorgia*. His philosophical opinions may be summed up in three propositions, which stand in direct relation to the teachings of the Eleatic school. He held (1) that there is nothing which has any real existence; (2) that, even if anything did really exist, it could not be known; and (3) that, supposing real existence to be knowable, the knowledge would be incommunicable. On the first point his argument was that a real existence must either have come into being or have been eternal. But the first alternative would require it to have been produced, either from the existent or from the non-existent; the second alternative would require us to identify it with the infinite, but as infinite exists nowhere (for that would involve the absurdity of its existing either within itself or within something else), but what exists nowhere is nothing. In support of the second proposition he argued that, if existence could be known, then thought would be existence, and the non-existent would be unthinkable and error would be impossible. The third point for which he argued was the inadequacy of language to convey ideas, and the impossibility of the idea being the same in different minds. In natural philosophy, his opinions, so far as these are known, appear to have been similar to those of Empedocles. See the monograph, *De Gorgia Leontino Commentatio*, by Foss, 1828.

GORGON, γοργώ, according to Hesychius, is a word akin to γοργός, which means terrible, lively, rapid. Sophocles (fr. 167) calls the sea-nymphs γοργίδες and γοργάδες is quoted as a title of the daughters of Oceanus. Now it is a well-established fact that the sea was at one time the sea of air and its nymphs the clouds. Hence we may infer that words from this stem are employed in the sense of quick-moving as epithets of the clouds.

The various forms in which the Gorgon appears in Greek mythology originate probably from the rapidly gathering terrible thunder-cloud. When the cloud covered the heaven and hid the sun, a primitive race, whose thoughts and words were few and simple, said that the sun was united in marriage to the cloud. From this union sprang the lightning and the thunder. Now the sun, in its different aspects and relations, was conceived in different ways, which developed, as thought unfolded itself, into distinct deities; and, as connected with clouds, rain, and the fertility that springs therefrom, he is the original of the Vedic Savitar and *Tvashtar* and of the Greek Poseidon. Accordingly (Hes., *Theog.*, 273 ff.) Poseidon on a meadow (i.e., the heaven, thus often in mythology) begat from the Gorgon Medusa Chrysaor and Pegasus. Chrysaor, Gold-sword, is obviously the lightning; and Pegasus, who bears the thunder and lightning for Zeus (*ibid.* 286), was probably at first simply the thunder. Gorgo and Erinyes are merely tribal or local varieties of the same conception; Gorgo is specially Attic, Erinyes Minyan. A similar legend occurs about children of Erinyes and Poseidon (Paus., viii. 37). Hence Æschylus (*Cho.*, 1048) compares the Erinyes to Gorgons.

Gorgo is always the impersonation of the atmospheric terrors, and is conceived in connexion with the deities that are armed with thunder and lightning—Zeus and Athene. With Athene in particular is the connexion very close, and some facts of ritual and nomenclature almost suggest an original identity of the two. Palæphatus says that Athene was worshipped in the island of Cerne under the name Gorgo; Sophocles (*Al.*, 450) calls her γοργώνις; and Plutarch (*Arat.*, 32) says that her wooden statue at Pallene, if

brought out of the temple, destroyed human life (compare the description of the birth of Athene in Pindar, *Ol.*, vii. 65 ff., which strongly suggests the phenomena of the thunderstorm). Here we have preserved to us a relic from the very earliest thought among the Indo-European race. When a phenomenon in the heavens attracted their attention, they naturally spoke of it as of an animated being. The storm appeared to act out its own natural course, to live its own life. But afterwards the phenomenon was conceived with reference to human needs: beneficent and hostile deities worked in nature; a hostile power denies to men what a friendly power after a conflict grants. Among the Greeks this opposition appears in the antithesis of Olympian and older or Chthonian gods. The goddess who ruled the storm for man was set in opposition to the actual thundercloud—Athene to Gorgo (see GRACES). Accordingly the usual Greek account is that the γοργόγνειον or γοργεῖν κεφαλή, a terror-striking countenance, is fixed in the middle of the ægis of Zeus. Zeus gives the ægis (*Iliad*, v. 736 ff., comp. *Æsch.*, *Eum.*, 825) to Athene, the goddess of the air. The Gorgoneion is always said to have been won in battle, viz., in the conflict of the beneficent gods against the older nature-powers, who would scorch the earth with heat and deny the needed rain. Zeus then assuming the ægis (the shield of the storm-cloud) overthrows the Titans or the Giants in the aerial battle; the rain descends, and a clearer and cooler sky succeeds. Or in other accounts the whole array of gods engages in the battle; Athene then appears naturally as γοργοφόνη, i.e., she clears the atmosphere, her own special domain, from the terrible cloud, which she keeps on her shield threatening death to all her foes. The Attic tradition was that the Gorgon was a monster produced by Earth to aid her distressed sons the Giants, and was slain by Pallas (*Eur.*, *Ion*, 1002). In Homer Gorgo appears also in connexion with Apollo, Agamemnon, Hector, and Persephone,—a connexion which might be justified by an examination into the mythological ideas that underlie these names.

Later accounts, beginning from Hesiod (*Theog.*, l.c.), mention three Gorgons; but Medusa alone inherits the character and history of the older Gorgo, while two sisters are added to make up the sacred number, in analogy with the Moiræ, Grææ, Erinyes, &c. The Argive story has established itself in all later literature as the standard account of the Gorgons. Perseus, the light-giving hero, aided by Athene and the other gods, goes to the abode of the Gorgons beside Oceanus far away in the dark West, and cuts off the head of Medusa. Then from the streaming neck sprang Chrysaor and Pegasus, her two sons by Poseidon. This head, which, like the lightning, had the power of turning into stone all that looked on it, was given to Athene, who placed it in her shield. According to another account, Perseus buried the head in the Agora of Argos. Beside it was buried his daughter Gorgophone, who is obviously a mere impersonation of the old epithet of the Gorgon-slaying goddess.

These ideas of sun and storm give only the starting point for the myths; the history of their further growth involves the whole subsequent history of the nation. Just as in Germany, after Christianity was introduced, many old myths and customs lived on applied to Christ and his apostles instead of the old gods, so must the Greek myths as we know them bear traces of the historical vicissitudes of the race. Hence Böttiger (*Kunst-Myth.*, i. 369) has possibly some ground for referring the Perseus tale to the extinction of Phœnician human sacrifices by the Greeks.

The gradual development in art from the old hideous and terrible representation of the Medusa head to the calm repose of a beautiful dead face is described in detail by Müller, *History of Ancient Art*, and *Denkmaler der Alten Kunst*. See also Rosenberg, *Die Erinyen*.

GORI, in Georgia, an ancient fortress, is now the chief town of a district of the same name in the government of Tiflis, and a station on the Poti-Tiflis railroad. It is built at the foot of an isolated hill crowned by the old fortifications, in a luxuriantly fertile plain on the left bank of the Kour, at the junction of the Bleejah'va and Medjoura, 48 miles west of Tiflis. The population, about 5000, is almost exclusively Armenian, engaged in commerce. The women are noted for their beauty. This town, at one time celebrated for its silk and cotton stuffs, is now famous for corn, reputed the best in Georgia; the wine is also esteemed, 5200 acres being laid out in vineyards. The climate is excellent, delightfully cool in summer, owing to the refreshing breezes from the mountains of the great Caucasian range, which, however, are at times disagreeably felt in winter. Gori was founded (1123) by David II., "the Restorer," for the Armenians who fled their country on the Persian invasion. The earliest remains of the fortress are Byzantine, but it was thoroughly restored in 1634–58, during the reign of Rustam, and destroyed by Nadir Shah. Besides the Armenian and Georgian churches, and some good schools, there is a church constructed in the 17th century by Capuchin missionaries from Rome. Gori was the birthplace (1773) of Stephân Peshanegishvily, a distinguished and popular poet. Eight miles from Gori is the remarkable rock-cut town of Ouplytz-tzykhè, consisting of several large dwellings having their interiors ornamented with mouldings, imitation beams, and designs sculptured in relief, and innumerable smaller habitations, the majority being divided into chambers with doorways, openings for light, and sundry provisions for domestic comfort. The whole have been hewn out of the solid rock, the groups being separated by streets, where steps for facilitating communication and grooves for water courses are cut. This "Fortress of Ouplytz" was projected and completed, according to the annals of Georgia, by Ouphlis, an immediate descendant of Noah (see GEORGIA). It was a fortress in the time of Alexander of Macedon, and an inhabited city in the reign of Bagrat III. (980–1014).

GORILLA. See APE, vol. ii. p. 148.

GÖRITZ. See GÖRZ.

GÖRLITZ, a town in the Prussian province of Silesia, capital of a circle in the government district of Liegnitz, is situated on the left bank of the Neisse, and at the junction point of several railways, 55 miles east of Dresden. The Neisse at this point is crossed by a railway bridge half a mile long and 120 feet high, with 32 arches. The town is the seat of a provincial office, a circle court, and a chamber of commerce. It is surrounded by beautiful walks and fine gardens, and although its old walls and towers have now been demolished, many of its ancient buildings remain to form a picturesque contrast with the signs of modern industry. From the hill called Landskrone, about 1500 feet high, an extensive prospect is obtained of the surrounding country. The principal buildings are the fine church of St Peter and St Paul, dating from the 15th century, with a famous organ and a very heavy bell; the church of Our Lady erected about the end of the 15th century, and possessing a fine portal and choir in pierced work; the Catholic church, founded in 1853, in the Roman style of architecture, with beautiful glass windows and oil-paintings; the town house, containing the arms of King Matthias of Hungary, and having at its entrance a fine flight of steps; the old bastion, named Kaisertrutz, now used as a guardhouse and armoury; the gymnasium buildings in the Gothic style erected in 1851; the fine new middle school, the real school, the provincial trade school, the theatre, and the barracks. Near the town is the chapel of the Holy Cross, in connexion with which there is a model of the Holy Grave at Jerusalem. In the public park there

is a bust of Schiller and a monument to Alexander von Humboldt; and a monument has also been erected in the town in commemoration of the war of 1870-71. In connexion with the National History Society there is a valuable museum, and the Scientific Institute possesses a large library and a rich collection of antiquities, coins, and articles of vertu. Gorlitz, next to Breslau, is the largest and most flourishing commercial town of Silesia. Besides cloth, which forms its staple article, it has manufactories of various linen and woollen wares, machines, railway waggons, sago, tobacco, leather, chemicals, and tiles.

Gorlitz existed as a village from a very early period, and at the beginning of the 12th century it was made a borough by Duke Sobieslaus I. of Bohemia. It was then known as Drebenau, but on being rebuilt after its destruction by fire in 1131 it received the name of Zgorzelice (burnt town). About the end of the 12th century it was strongly fortified, and in 1346 it joined the league of the six towns. It was several times besieged and taken during the Thirty Years' War, and it also suffered considerably in the Seven Years' War. In the battle which took place near it between the Austrians and Prussians, 7th September 1757, Winterfeldt, the general of Frederick the Great, was slain. In 1815 the town, with the greater part of Upper Lusatia, came into the possession of Prussia. The population in 1831 was only about 8000, but in 1849 it had increased to 19,082, and in 1875 it was 45,310.

GÖRRES, JOSEPH JOHANN (1776-1848), a distinguished controversialist and writer on religious, political, and scientific subjects, was born January 25, 1776, at Coblenz. His father was a man of moderate means, who sent his son, after he had passed through the usual elementary school, to a Latin college under the direction of the Roman Catholic clergy. The sympathies of the young Görres were from the first strongly with the Revolution, and the dissoluteness and irreligion of the French exiles in the Rhineland confirmed him in his hatred of princes. He harangued the revolutionary clubs, and in his first political tract, called *Universal Peace, an Ideal*, he insisted on the unity of interests which should ally all civilized states to one another. He then commenced a republican journal called *Das Rote Blatt*, and afterwards *Rübezahl*, in which he strongly condemned the administration of the Rhenish provinces by France.

After the peace of Campo Formio (1797) there was some hope that the Rhenish provinces would be constituted into an independent republic. In 1799 the provinces sent an embassy, of which Görres was a member, to Paris to put their case before the directory. The embassy reached Paris on the 20th of November 1799; two days before this Napoleon had assumed the supreme direction of affairs. After much delay the embassy was received by him; but the only answer they obtained was "that they might rely on perfect justice, and that the French Government would never lose sight of their wants." Görres on his return published a tract called *Results of my Mission to Paris*, in which he reviewed the history of the French Revolution. During the thirteen years of Napoleon's dominion Görres lived a retired life, devoting himself chiefly to art or science. In 1801 he married Catherine de Lassaulx, and those of Görres's admirers who claim him as a radical have laid great stress on the fact that this lady was a free-thinker. He published *Aphorisms* on art and physiology—fanciful but suggestive. He was for some years teacher at a secondary school in Coblenz, and in 1806 moved to Heidelberg, where he lectured at the university. He sought, with Brentano, Arnim, and others, to stir up the old national spirit by the republication of some of the old Teutonic ballads, but fruitlessly. He returned to Coblenz in 1808, and again found occupation as a teacher in a secondary school, supported by civic funds. He now studied Persian, and in two years produced a really valuable translation of part of the *Shahnamah*, the epic of Firdousi.

It was in the year 1810 that he seems to have conceived the notion of arousing the people to efforts by means of the press; and after the battle of Leipsic, in the year 1814, he set his paper going. It bore the name of a paper which had been a mere echo of Prussia, the *Rheinischer Merkur*. The intense earnestness of the paper, the bold outspokenness of its hostility to Napoleon, and its fiery eloquence secured for it almost instantly a position and influence unique in the history of German newspapers. Blücher read it every day; Gentz, the brothers Grimm, Varnhagen von Ense, were all loud in praise of it; Stein used it as an instrument to move the public in the direction he desired, and continually sent it information of his plans; Napoleon himself called it *la cinquième puissance*. The ideal it insisted on was a united Germany, with a representative government, but under an emperor after the fashion of other days,—for Görres now abandoned his early advocacy of republicanism. When Napoleon was at Elba, Görres wrote an imaginary proclamation issued by him to the people, the intense irony of which was so well veiled that many Frenchmen mistook it for an original utterance of the emperor. He inveighed bitterly against the second peace of Paris (1815), declaring that Alsace and Lorraine should have been demanded back from France.

Stein was glad enough to use the *Merkur* at the time of the meeting of the congress of Vienna as a vehicle for giving expression to his hopes. But Hardenberg, in May 1815, warned Görres to remember that he was not to arouse hostility against France, but only against Bonaparte. There was also in the *Merkur* an antipathy to Prussia, a continual expression of the desire that an Austrian prince should assume the imperial title, and also a tendency to pronounced liberalism,—all of which made it most distasteful to Hardenberg, and to his master King Frederick William III. Görres disregarded warnings sent to him by the censorship and continued the paper in all its fierceness. Accordingly it was suppressed early in 1816, at the instance of the Prussian Government; and soon after Görres was dismissed from his post as teacher at Coblenz. From this time his writings were his sole means of support, and he became a most diligent political pamphleteer. He was not himself a member of the *Tugendbund*, but he watched that society with deep interest, and believed, as did all the patriots of his time, that the clubs of students, or *Burschenschaften*, were calculated to restore the pristine greatness of Germany. The agitation continued, and finally Kotzebue's denunciation of young Germany led to his assassination. In the wild excitement which followed, the reactionary decrees of Carlsbad were framed, and these were the subject of Görres's celebrated pamphlet *Deutschland und die Revolution*. In this work he reviewed the circumstances which had led to the murder of Kotzebue, and, while expressing all possible horror at the deed itself, he urged that it was impossible and undesirable to repress the free utterance of public opinion by reactionary measures. The success of the work was very marked, despite its ponderous style. It was suppressed by the Prussian Government, and orders were issued for the arrest of Görres and the seizure of his papers. He escaped to Strasburg, and thence went to Switzerland. Two more political tracts, *Europa und die Revolution* (1821), and *In Sachen der Rhein Provinzen und in eigener Angelegenheit* (1822), also deserve mention.

In Görres's pamphlet *Die Heilige Allianz und die Völker auf dem Congress von Verona* he asserted that the princes had met together to crush the liberties of the people, and that the people must look elsewhere for help. The "elsewhere" was to Rome; and from this time Görres became a vehement Ultramontane writer. He was summoned to Munich by King Louis of Bavaria, and there his writings

enjoyed very great popularity. His *Christliche Mystik* gave a series of biographies of the saints, together with an exposition of Roman Catholic mysticism. But his most celebrated Ultramontane work was a polemical one. Its occasion was the deposition and imprisonment by the Prussian Government of the archbishop Clement Wenceslaus, in consequence of the refusal of that prelate to sanction in certain instances the marriages of Protestants and Roman Catholics. Gorres in his *Athanasius* fiercely upheld the power of the church, although the liberals of later date who have claimed Gorres as one of their own school deny that he ever insisted on the absolute supremacy of Rome. *Athanasius* went through several editions, and originated a long and bitter controversy. In the *Histo-risch-politische Blätter*, a Munich journal, Görres and his son Guido continually upheld the claims of the church. Görres received from the king the order of merit for his services. He was terribly disturbed when the king sunk under the dominion of Lola Montez, and he died July 29, 1848.

See A. Denk, *Joseph von Gorres*, 1870; J. J. Sepp, *Gorres und seine Zeitgenossen*, 1877. A complete edition of Gorres's works was published at Munich in 1854. (L. A. M.)

GORTSCHAKOFF (GORCHAKOV), a noble Russian family, descended from Michael Vsevolodovich, prince of Chernigoff, who, in 1246, was assassinated by the Mongols. The following are the most distinguished members of this family. PETR DIMITRIEVICH (1790-1868) served under Kamensky and Kutuzoff in the campaign against Turkey, and afterwards against France in 1813-1814. In 1820 he suppressed an insurrection in the Caucasus, for which service he was raised to the rank of major-general. In 1828-29 he fought under Wittgenstein against the Turks, occupied Aidos, and signed the treaty of peace at Adrianople. In 1839 he was made governor of eastern Siberia, and in 1851 retired into private life. When the Crimean war broke out he offered his services to the emperor Nicholas, by whom he was appointed general of the 6th army corps in the Crimea. At the battles of Alma and Inkerman he commanded the left wing of the Russian army. In 1855 he retired, and died at Moscow, March 18, 1868. MIKHAIL DIMITRIEVICH (1792-1861), brother of the preceding, was born in 1792. In 1807 he entered the Russian army, in 1810 he took part in the campaigns against Persia, and in 1812-1815 against France. During the Russo-Turkish war of 1828-29, he directed the operations of the sieges of Silistria and Shumla. After being appointed, in 1830, general of artillery, he was present in the campaigns in Poland, and was wounded at the battle of Grochow, February 25, 1831. He also distinguished himself at the battle of Ostrolenka and at the taking of Warsaw. For these services he was promoted to the rank of lieutenant-general. In 1846 he was nominated military governor of Warsaw. In 1849 he commanded the Russian artillery against the Hungarians, and in 1852 he visited London as a representative of the Russian army at the funeral of the duke of Wellington. Upon Russia declaring war against Turkey in 1853, he was appointed commander-in-chief of the troops, numbering in all some 60,000 men, which occupied Moldavia and Wallachia. On the 23d March 1854 he crossed the Danube and besieged Silistria, but was superseded in April by Prince Paskievich, who, however, resigned on the 8th of June, when Gortschakoff resumed the command. In July the siege of Silistria was raised, and the Russian armies recrossed the Danube; in August they withdrew to Russia. In 1855 he was appointed commander-in-chief of the Russian forces in the Crimea in place of Prince Mentshikoff. Gortschakoff's defence of Sebastopol, and final retreat to the northern part of the town, which he continued to defend till peace was signed in Paris, were con-

ducted with skill and energy. In 1856 he was appointed governor-general of Poland. He died at Warsaw on the 30th May 1861.

GORTYNA, or GORTYN, an important ancient city on the southern side of the island of Crete. It stood on the banks of the small river Lethæus (Mitropolipotamo), at a short distance from the sea, with which it communicated by means of its two harbours, Metallum and Lebena. It had temples of Apollo Pythius, Artemis, and Zeus. Near the town was the famous fountain of Sauros, inclosed by fruit-bearing poplars; and not far from this was another spring, overhung by an evergreen plane-tree which in popular belief marked the scene of the amours of Jupiter and Europa. Gortyna was, next to Cnossus, the largest and most powerful city of Crete. The two cities combined to subdue the rest of the island; but when they had gained their object, they quarrelled with each other, and the history of both towns is from this time little more than a record of their feuds. Neither plays a conspicuous part in the history of Greece. Under the Romans Gortyna became the metropolis of the island. Some ruins may still be traced at the modern village of Hagii Deka.

GÖRZ, with GRADISCA, is one of the crown-lands of the Austrian monarchy, between 45° 36' 3" and 46° 27' N. lat., and bounded N. by Carinthia, E. by Carniola, Istria, and the Triestine territory, S. by the Triestine territory and the Adriatic, and W. by Italy. On all sides, except towards the south-west where it unites with the Friulian lowland, it is surrounded by mountains, and four-sixths at least of its area of 1140 square miles is occupied by mountains and hills. From the ridge of the Julian Alps, which rise in an almost unbroken line to a height of 6000 or 7000 feet, the country descends in successive terraces towards the sea, and may roughly be divided into the upper highlands, the lower highlands, the hilly district, and the lowlands. The highest summit is the Terglou, 9370 feet, in the north-west. Geologically the country is a great limestone district, comprising limestone of many different formations, Rhætan, Jurassic, Neocomian, and Nummulitic; and the strata have evidently undergone a series of powerful disturbances. The hydrography is sufficiently peculiar, a considerable proportion of the circulation of the waters taking place by underground channels. The limits of the country coincide in the main with that of the basin of the Isonzo, which rises in the extreme north at a height of 2650 feet, and pursues a strange zigzag course for a distance of 78 miles before it reaches the Adriatic. At Görz the Isonzo is still 138 feet above the sea, and it is navigable only in its lowest section, where it takes the name of the Sdobba. Its tributaries, of which the most important are the Idria, the Torre, and the Wippach, are little more than mountain streams. Of special interest not only in itself but for the frequent allusions to it in classical literature is the Timavus or Timavo. In ancient times it appears, according to the well-known description of Virgil (*Æn.*, i. 244) to have rushed from the mountain by nine separate mouths and with much noise and commotion, but at present it usually issues from only three mouths and flows quiet and still. It is strange enough, however, to see the river coming out full formed from the rock, and capable at its very source of bearing vessels on its bosom. According to a probable hypothesis it is a continuation of the river Reka which is lost in a cleft of the rock in the south-east of the country near S. Canziano. The coast-line of Görz and Gradisca, though extending for 25 miles, presents no harbour of much importance. It is fringed by alluvial deposits and lagoons which are for the most part of very modern formation; for as late as the 4th or 5th centuries Aquileia was a great seaport. The harbour of Grado is the only one accessible

to the larger kind of coasting craft. A large part of the country formerly covered with forest has been recklessly cleared, but the Tarnova plateau is still a fine wooded district with an area of about 35 or 40 square miles. The red beech is the predominant and in some parts almost the exclusive tree, but it is being displaced by the fir and the pine. A number of pits in the plateau are full of ice all the year round, and yield about 16,000 cwts. annually for the consumption of the neighbouring countries. More than a fifth of the area of the country is pasture-land, and less than a twenty-fourth is under the plough.

The vine is largely cultivated, being not only planted in regular vineyards but introduced in long lines through the ordinary fields and carried up the hills in terraces locally called *ronchi*. Wheat, maize, buck-wheat, and potatoes are the usual crops. Silk growing is largely carried on, especially in the lowlands, and furnishes the material for the most extensive industry of the country. There are about 2000 workers in silk, and the produce is worth upwards of £200,000, while the cotton manufacture, which is next in importance, employs about 1000, and produces £100,000. Leather, linen, paper, and soap are manufactured on a smaller scale. The trade of the country is of very little importance. Görz and Gradisca, according to the constitution of 1861, have a diet consisting of six representatives of the landed proprietors, seven representatives of the towns and industrial interests, and eight representatives of the rural communes. The elector for the landed interest must pay 100 florins (about £10) of land-tax in the Italian circle, and 50 florins (about £5) in the Slovenian circle. Two representatives are sent to the imperial council. The political administration is in the hands of the lieutenant of the coast-lands, which include not only Görz and Gradisca but also Trieste and Istria. Roman Catholicism is the exclusive religion, the only Protestant community being in the town of Görz, and the Jews numbering only some 400. Ethnographically the population must contain much more various elements, but in 1857, out of a total of 196,276 inhabitants, 130,748 were registered as Slovenians, 47,841 as Friulians, 15,134 as Italians, and only 2150 as Germans.

Görz first appears distinctly in history about the close of the 10th century, as part of a district bestowed by the emperor Otto III. on John, patriarch of Aquileia. In the 11th century it became the seat of the Eppenstein family, who frequently bore the title of counts of Gorizia; and in the beginning of the 12th century the countship passed from them to the Lurnan family which continued to exist till the year 1500, and acquired possessions in Tyrol, Carinthia, Friuli, and Styria. In the course of the 18th and 14th centuries the counts often appear as protectors (*Schirmvogt* or *Advocatus*) of the church of Aquileia and as captains-general of Friulia. When the Venetians took possession of Friulia they gave Count Henry the title of hereditary marshal as a compensation for his loss of office. The right of coining was exercised by the counts from the 13th century. On the death of Count Leonhard (12th April 1500) the fief reverted to the house of Hapsburg.

GORZ, GORTZ, or GORIZ (Italian, *Gorizia*; Modern Latin, *Goritia*), the chief town of the crown-land, is beautifully situated in the fruitful valley of the Isonzo, 25 miles N.N.W. of Trieste by railway. It is the seat of an archbishop, of a circle court, and of a head tax-office. The principal buildings are the cathedral, the former Jesuit church and college now converted into barracks, the convents of the brothers and sisters of mercy, of the Franciscans, of the Capuchins, and of the Ursulines, the municipal buildings, the theatre, the house of the bishop, and the old castle of the former counts of Tyrol and Görz now converted into a prison. Among the educational establishments are a central episcopal seminary, a gymnasium, an upper real-school, a deaf and dumb institute, and an agricultural school. The industries include cotton and silk weaving, sugar refining, brewing, the manufacture of leather, and the making of *rosoglio*. There is also a considerable trade in wooden work, fruit, and wine. On

account of its mild climate the town is coming to be much resorted to by invalids in winter. Charles X., the exiled king of France, died at Gorz 6th November 1836. The population of the town in 1869 was 16,659.

Besides the great monograph of K. von Czornig, *Das Land Gorz und Gradisca*, Vienna, 1873 and 1874, see Siegmund, *Südliche Klimatische Kurorte*, Vienna, 1875; Coronini, *Fastorum Goritiensium lib. i.*, Vienna, 1769, and *L'Antica moneta Goriziana*, Gorz, 1785; Schweizer, *Abregé de l'histoire des comtes de Gorice*, Trieste, 1859; Carlo Morelli of Schönfeld, *Istoria della Contea di Gorizia*, Gorz, 1855-56; Della Bona, *Sunto istorico di Gorizia e di Gradisca*, Gorz, 1853; Siebert, *Gorz, Stadt und Land*.

GOS-HAWK, *i.e.*, Goose-Hawk, the *Astur palumbarus* of ornithologists, and the largest of the short-winged Hawks used in Falconry. Its English name, however, has possibly been transferred to this species from one of the long-winged Hawks, or true Falcons, since there is no tradition of the Gos-Hawk, now so called, having ever been used in Europe to take Geese or other large and powerful birds. The genus *Astur* may be readily distinguished from *Falco* by the smooth edges of its beak, its short wings (not reaching beyond about the middle of the tail), and its long legs and toes—though these last are stout and comparatively shorter than in the Sparrow-Hawks (*Accipiter*). In plumage the Gos-Hawk has a general resemblance to the Peregrine Falcon (see FALCON, vol. ix. p. 2), and it undergoes a corresponding change as it advances from youth to maturity—the young being longitudinally streaked beneath, while the adults are transversely barred. The irides, however, are always yellow, or in old birds orange, while those of the Falcons are dark brown. The sexes differ greatly in size. There can be little doubt that the Gos-Hawk, now-a-days very rare in Britain, was once common in England, and even towards the end of the last century Thornton obtained a nestling in Scotland, while Irish Gos-Hawks were of old highly celebrated. Being strictly a woodland-bird, its disappearance may be safely connected with the disappearance of our ancient forests, though its destructiveness to Poultry and Pigeons has doubtless contributed to its present scarcity. In many parts of the continent of Europe it still abounds. It ranges eastward to China, and is much valued in India (see FALCONRY, vol. ix. p. 11). In North America it is represented by a very nearly allied species, *A. atricapillus*, chiefly distinguished by the closer barring of the breast. Three or four examples corresponding with this form have been obtained in Britain. A good many other species of *Astur* (some of them passing into *Accipiter*) are found in various parts of the world, but the only one that need here be mentioned is the *A. novæ-hollandiæ* of Australia, which is remarkable for its dimorphism—one form possessing the normal dark-coloured plumage of the genus, and the other being perfectly white, with crimson irides. It must be stated, however, that some writers hold these two forms to be distinct species, and call the dark-coloured one *A. cinereus* or *A. raii*. (A. N.)

GOSHEN (גֹּשֶׁן), or the land of Goshen, a territory of Egypt in which the Israelites were settled from Jacob's immigration to the Exodus. In the Septuagint the equivalent is usually the land Gesem (Γεσέμ), but in Gen. xlv. 10 "the land Gesem of Arabia," Arabia being here either the Arabian nome (*Ἀραβίας νομός*) or the extreme east of Lower Egypt. According to Dr Brugsch the Arabian nome was the 20th of Lower Egypt in the older division known to us, the 32d in the later, the alteration in the number being due to a new division under the Ptolemies (*Dict. Géogr.*, List following preface). The Egyptian name of the nome was Supt, and the capital was Kesem, probably Kosem, also called Kesem-Abot, Kesem of the East (Arabia), equivalent to the Gesem of the Septuagint, preserved in the classical Phacusa (Pa-Kesem), and the modern Fakos, where mounds mark the site of the ancient town (*cf.* Brugsch,

16., 876-7, 1049-50). The etymology is doubtful; probably the name is like many others in the same part of Egypt of Semitic origin, as another land of Goshen, with a capital city of the same name, is mentioned in southern Palestine. It is therefore certain that the land of Goshen was around the town of Phacusa. The site of this town lies within the easternmost part of Lower Egypt, under 20 miles in a direct line south of Sán, the site of Tanis. These conditions suit those of the Biblical narrative. It is obvious that Goshen was a pastoral country, that it was suited for a Shemite settlement, and was in the Shemite part of Lower Egypt, its north-eastern portion. It was near the seat of government in that part of the country, which at this time was Tanis-Rameses, which town, or another of the same name, was the starting-point at the Exodus. In one place (Gen. xlvii. 11) the "land of Rameses" occurs where we should expect "the land of Goshen." We are not sufficiently acquainted with the administrative divisions at this early time to be able to explain this. It may, however, be conjectured that if the Rameses of the Exodus journey was the same as Tanis-Rameses, the archaic Tanite nome may have included the land of Goshen.

GOSLAR, a town in the district of Hildesheim, Prussia, province of Hanover, is situated on the Gose, an affluent of the Ocker, at the foot of the Harz, 24 miles S.E. of Hildesheim. It is surrounded by walls, and has a very antique appearance. Among the noteworthy buildings are the market church, in the Romantic style, restored since its partial destruction by fire in 1844, and containing the town archives, and a library in which are some of Luther's manuscripts; the old town-house, possessing many interesting antiquities; the Kaiserworth, with the statues of the German emperors; the Kaiserhaus, founded by Henry III. in 1050, and along with the adjoining Ulrich's chapel restored in 1873 at the cost of the Prussian Government; the small chapel, which is all that remains since 1820 of the old cathedral founded by Henry III. in 1040, containing among other antiquarian relics of the cathedral an old altar supposed to be that of the idol Krodo which formerly stood on the

top of the Burgberg near Neustadt-Harzburg; the church of the monastery of Neuwerk, in the Roman style, with wall paintings of considerable merit; and the house of the bakers' guild, the birthplace of Marshal Maurice of Saxony. There are four Evangelical churches, one Catholic church, a synagogue, a real school of the first order, a higher girls' school, and a number of small foundations. The population are chiefly occupied in connexion with the sulphur, copper, silver, and other mines in the neighbourhood. The town has also been long noted for its beer, and possesses some small manufactures, and a considerable trade in fruit. The population in 1875 was 9838.

Goslar was founded by Henry the Fowler about 920, and when in the time of Otto the Great the mineral treasures in the neighbourhood were discovered it increased rapidly in prosperity. It was frequently the seat of German diets, and the residence of the emperor. About 1350 it joined the Hanseatic League. It was unsuccessfully besieged in 1625, during the Thirty Years' War, but was taken by the Swedes in 1632, and nearly destroyed by fire. Additional conflagrations in 1728 and 1780 gave a severe blow to its ancient prosperity. It was a free town till 1802, when it came into possession of Prussia. In 1807 it was joined to Westphalia, in 1816 to Hanover, and in 1866 it was, along with Hanover, reunited to Prussia.

GOSLICKI, WAWRZYNIEC (1533-1607), a learned Pole, better known under his Latinized name of Laurentius Grimalius Goslicius, was born about 1533. After having studied first at Cracow and afterwards at Padua, he entered the church, and was successively appointed bishop of Kaminietz and of Posen. Goslicki, although an ecclesiastic, was an active man of business, was held in high estimation by his contemporaries, and was frequently engaged in political affairs. It was chiefly through his influence, and through the letter he wrote to the pope against the Jesuits, that they were prevented from establishing their schools at Cracow. He was also a strenuous advocate of religious toleration in Poland. He died October 31, 1607.

His principal work is *De optimo senatore*, &c. (Venice, 1568). There are two English translations published respectively under the titles *A commonwealth of good counsaile*, &c. (1607), and *The Accomplished Senator, done into English by Mr Oldisworth* (1738).

## G O S P E L S

### SYNOPTICAL GOSPELS.

OF the four canonical Gospels<sup>1</sup> (*god*, God or good; *spell*, discourse or tidings, cf. εὐαγγέλιον) the first three (differing from the fourth) agree in narrating nearly the same events in somewhat similar language, and are hence called synoptical (σύν, together; ὄψις, view). It will be advantageous to begin with the treatment of these, as to their origin, date, and objects, so far as can be determined from (1) internal evidence and (2) external evidence.

#### Internal Evidence.

In discussing the internal evidence, it will be convenient to speak, first, of those portions of the synoptic narrative which are found in three Gospels; then of those which are found in only two; and, lastly, of those which are found in only one.

*The Triple Tradition.*—Few are aware of the very small extent to which independent narrators of the same events use the same words. A comparison of a few specimens of independent narratives (of such events, for example, as the attempt to assassinate King Humbert, or the recent death of the Prince Imperial) would show that the narratives often contain scarcely two or three consecutive words in common, and rarely or never a whole clause of five or six words. The same statement applies to narratives of discourses of any length reported from memory, and not from notes taken at the moment. Now it is well known

that in many parts of the first three Gospels the same Originality words and phrases are curiously interlaced, in such a way of Mark.

as to suggest that the writers have borrowed either from each other or from some common source. For example, in describing the healing of the sick (Mat. viii. 16; Mk. i. 32; Lu. iv. 40), Matthew begins thus: ὁφίας δὲ γενομένης; Mark, ὁφίας δὲ γενομένης ὅτε ἔδυσεν ὁ ἥλιος; Luke, δύνωντος δὲ τοῦ ἡλίου. From this and many similar passages it might seem natural to infer that Mark borrowed one of these expressions from Matthew and the other from Luke, and that the narrative of Mark is little more than a combination of passages from Matthew and Luke. This is an inference which has actually been drawn by many critics both before and since De Wette; but at present it finds comparatively little support among competent investigators. However, the oscillations of New Testament criticism have been so numerous that it may be of use to indicate a method by which the originality of Mark may be established on an immovable basis. That Mark (at all events in many parts) contains the original document or tradition from which Matthew and Luke have borrowed can be proved to demonstration by a necessary inference from the following specimen of narrative common to the three writers.<sup>2</sup>

<sup>2</sup> From a *Harmony of the Synoptic Gospels*, now in preparation, by Mr W. G. Rushbrooke, B.A., formerly Scholar of St John's College, Cambridge. The text followed here and throughout this article has been generally that of Tischendorf.

MATTHEW XXI. 33—44.

33 Ἀ-λ-λ-η-ν παραβολὴν ἀ-κ-ο-ύ-σ-α-τ-ε. Ἀνθρώπος ἦ-ν ο-ἰ-κ-ο-δ-ε-σ-π-ό-τ-η-ς, ὁ-σ-τ-ι-ς ἐφύ-τευ-σεν ἀμπελῶνα, καὶ φραγμὸν ἀ-ὕ-τ-ῳ περιέθηκεν καὶ ὥρυξεν ἐ-ν ἀ-ὕ-τ-ῳ λην-ὸ-ν καὶ ὠκοδόμησεν πύργον, καὶ ἐξέδετο αὐτὸν γεωργοῖς, καὶ ἀπεδήμησεν. 34 ὁ-τ-ε δὲ ἡ-γ-γ-ι-σ-ε-ν ὁ- καιρ-ὸ-ς τ-ῶ-ν κ-α-ρ-π-ῶ-ν, ἀπέστειλεν τ-ο-ὺ-ς δούλ-ο-υ-ς α-ὕ-τ-ο-ῦ πρὸς τοὺς γεωρ-γ-οὺς λαβ-ε-ῖ-ν τ-ο-ὺ-ς καρπ-ο-ὺ-ς α-ὕ-τ-ο-ῦ. 35 καὶ λαβόντες οἱ γεωρ-γ-οὶ τ-ο-ὺ-ς δ-ο-ύ-λ-ο-υ-ς α-ὕ-τ-ο-ῦ δ-ν μὲν ἔδειραν, δ-ν δὲ ἀπέκτε-ι-ν-α-ν, δ-ν δὲ ἐ-λ-ι-θ-ο-β-ό-λ-η-σ-α-ν.

36 πάλιν ἀπέστειλεν ἄλλ-ο-υ-ς δούλ-ο-υ-ς π-λ-ε-ί-ο-ν-α-ς τ-ῶ-ν π-ρ-ώ-τ-ω-ν, καὶ ἐ-π-ο-ί-η-σ-α-ν α-ὕ-τ-ο-ῦ-ς ὡ-σ-α-ὕ-τ-ω-ς.

37 ὁ-σ-τ-ε-ρ-ο-ν δὲ ἀπέστειλεν πρὸς αὐτοὺς τ-ὸ-ν υἱὸν α-ὕ-τ-ο-ῦ λέγων· Ἐντραπήσονται τὸν υἱὸν μου. 38 οἱ δὲ γεωργοὶ ἰδόντες τ-ὸ-ν υ-ἱ-ὸ-ν ἐ-π-ο-ν-έ-ν-ε-α-ν-ο-ῦ-ς· Οὗτός ἐστιν ὁ κληρονόμος· δεῦτε ἀποκτείνωμεν αὐτὸν καὶ σ-χ-ῶ-μ-ε-ν-τ-ὴ-ν κληρονομ-ί-α-ν α-ὕ-τ-ο-ῦ. 39 καὶ λαβόντες αὐτὸν ἐξέβαλον ἔξω τοῦ ἀμπελῶ-ν-ος καὶ ἀπέκτειναν. 40 ὁ-τ-α-ν οὖν ἔ-λ-θ-ῃ ὁ κύριος τοῦ ἀμπελῶ-ν-ος, τί ποιήσει τ-ο-ῖ-ς γεωρ-γ-ο-ῖ-ς ἐ-κ-ε-ῖ-ν-ο-ι-ς; 41 λ-έ-γ-ο-υ-σ-ι-ν α-ὕ-τ-ῳ· Κ-α-κ-ο-ὺ-ς κ-α-κ-ῶ-ς ἀπολέ-σ-ει α-ὕ-τ-ο-ῦ-ς, καὶ τὸν ἀμπελῶνα ἐ-κ-δ-ώ-σ-ε-τ-α-ι ἄλλοις γεωρ-γ-ο-ῖ-ς, ο-ἵ-τ-ι-ν-ε-ς ἀ-π-ο-δ-ώ-σ-ο-υ-σ-ι-ν α-ὕ-τ-ῳ τ-ο-ὺ-ς κ-α-ρ-π-ο-ὺ-ς ἐ-ν τ-ο-ῖ-ς κ-α-ι-ρ-ο-ῖ-ς α-ὕ-τ-ῳ.

42 λ-έ-γ-ε-ι αὐτοῖς ὁ Ἰ-η-σ-ο-ὺ-ς· Οὐδ-έ-π-ο-τ-ε ἀνέγνωτε ἐν ταῖς γρα-φ-αῖ-ς· Λίθον δὲν ἀπεδοκίμασαν οἱ οἰκοδομοῦντες, οὗτος ἐγενήθη εἰς κεφαλὴν γωνίας· παρὰ Κυρίου ἐγένετο αὕτη, καὶ ἔστιν θαυμαστή ἐν ὀφθαλμοῖς ἡμῶν; 43 δι-ὰ τ-ο-ῦ-τ-ο λ-έ-γ-ω ὑ-μ-ῖ-ν ὁ-τ-ι ἁ-ρ-θ-ῇ-σ-ε-τ-α-ι ἡ-φ' ὑ-μ-ῶ-ν ἡ β-α-σ-ι-λ-ε-ῖ-α τ-ο-ῦ Θε-ο-ῦ καὶ δ-ο-θ-ῇ-σ-ε-τ-α-ι ἐ-θ-ν-ε-ι π-ο-ι-ο-ῦ-ν-τι τ-ο-ὺ-ς κ-α-ρ-π-ο-ὺ-ς α-ὕ-τ-ῳ.

44 Κ-α-ὶ ὁ πεσὼν ἐπ-ὶ τὸν λίθον τ-ο-ῦ-τ-ο-ν συνθλασθήσεται· ἐφ' ὃν δ' ἂν πέσῃ, λικμήσει αὐτόν.

LUKE XX. 9—18.

9 Ἡρξάτο δὲ π-ρ-ὸ-ς τ-ὸ-ν λ-α-ὸ-ν λ-έ-γ-ε-ν-τ-ὴ-ν παραβολὴν τ-α-ὕ-τ-ῳ· Ἀνθρώπος ἐφύτευ-σεν ἀμπελῶνα καὶ ἐξέδετο αὐτὸν γεωργοῖς, καὶ ἀπεδήμησεν χ-ρ-ό-ν-ο-υ-ς ἱ-κ-α-ν-ο-ύ-ς. 10 καὶ καιρῷ ἀπέστειλεν πρὸς τοὺς γεωρ-γ-οὺς δούλον, ἵνα ἀπὸ το-ῦ καρπο-ῦ τοῦ ἀμπελῶνος δ-ώ-σ-ο-υ-σ-ι-ν α-ὕ-τ-ῳ· οἱ δὲ γεωργοὶ ἐξ-απέστειλαν αὐτὸν δ-εί-ρ-α-ν-τ-ε-ς κενόν.

11 καὶ π-ρ-ο-σ-έ-θ-ε-τ-ο ἕ-τ-ε-ρ-ο-ν π-έ-μ-ψ-α-ι· οἱ δὲ κἀκείνους δ-ε-ί-ρ-α-ν-τ-ε-ς καὶ ἀ-τιμ-ά-σ-α-ν-τ-ε-ς ἐξ-α-π-έ-σ-τ-ε-ι-λ-α-ν κ-ε-ν-όν. 12 καὶ π-ρ-ο-σ-έ-θ-ε-τ-ο τ-ρ-ί-τ-ο-ν π-έ-μ-ψ-α-ι· οἱ δὲ καὶ τ-ο-ῦ-τ-ο-ν τ-ρ-α-υ-μ-α-τ-ί-σ-α-ν-τ-ε-ς ἐξ-έ-β-α-λ-ο-ν.

13 ἐ-ἰ-π-ε-ν δὲ ὁ κ-υ-ρ-ι-ο-ς τ-ο-ῦ ἀ-μ-π-ε-λ-ῶ-ν-ο-ς· Τ-ί π-ο-ι-ή-σ-ω; π-έ-μ-ψ-ῶ τὸν υἱὸν μου τ-ὸ-ν ἀ-γα-π-η-τόν· ἵ-σ-ω-ς τ-ο-ῦ-τ-ο-ν ἐντραπήσονται. 14 ἰδόντες δὲ α-ὕ-τ-ο-ν οἱ γεωργοὶ δι-ε-λ-ο-γ-ί-ζ-ο-ν-τ-ο πρὸς ἄ-λ-λ-ῃ-λ-ο-υ-ς λ-έ-γ-ο-ν-τ-ε-ς· Οὗτός ἐστιν ὁ κληρονόμος· ἀποκτείνωμεν αὐτόν ἵ-να ἡμῶν γ-έ-ν-η-τ-α-ι ἡ κλη-ρονομία. 15 καὶ ἐκβαλόν-τ-ε-ς αὐτόν ἔξω τοῦ ἀμπελῶνος ἀπέ-κτειναν. τί οὖν ποιήσει α-ὕ-τ-ο-ῖ-ς ὁ κύριος τοῦ ἀμπελῶνος; 16 ἐ-λ-ε-ῖ-σ-ε-ται καὶ ἀπολέσει τοὺς γεωρ-γ-οὺς τ-ο-ῦ-τ-ο-υ-ς, καὶ δώσει τὸν ἀμπε-λῶνα ἄλλοις. ἀ-κ-ο-ῦ-σ-α-ν-τ-ε-ς δὲ ἐ-ἰ-π-α-ν, Μ-ὴ γ-έ-ν-ο-ι-τ-ο.

17 ὁ δὲ ἐ-μ-β-λ-έ-ψ-α-ς αὐτοῖς ἐ-ἰ-π-ε-ν· Τ-ί οὖν ἐ-σ-τ-ι-ν τὸ γ-ε-γ-ρα-μ-μ-έ-ν-ο-ν τ-ο-ῦ-τ-ο-· Λίθον δὲν ἀπεδοκίμασαν οἱ οἰκοδομοῦντες, οὗτος ἐγενήθη εἰς κεφαλὴν γωνίας;

18 π-ᾶ-ς δ' πεσὼν ἐπ' ἐ-κ-ε-ῖ-ν-ο-ν τὸν λίθον συνθλασθήσεται· ἐφ' ὃν δ' ἂν πέσῃ, λικμήσει αὐτόν.

MARK XII. 1—11.

1 Κ-α-ὶ ἤρξατο α-ὕ-τ-ο-ῖ-ς ἐ-ν παραβολ-αῖ-ς λ-α-λ-ε-ῖ-ν. Ἀμπε-λῶνα ἄνθρωπος ἐφύτευ-σεν, καὶ περιέθηκεν φραγμὸν καὶ ὥρυξεν ὑ-π-ο-λ-η-ν-ι-ο-ν καὶ ὠκοδόμησεν πύργον, καὶ ἐξέδετο αὐτὸν γεωρ-γ-οῖς, καὶ ἀπεδήμησεν. 2 καὶ ἀπέ-στειλεν πρὸς τοὺς γεωρ-γ-οὺς τ-ῳ καιρῷ δούλον, ἵνα π-α-ρ-ὰ τ-ῳ καιρῷ γεωρ-γ-ῶ-ν λ-ά-β-ῃ ἀπὸ τῶ-ν καρ-π-ῶ-ν τοῦ ἀμπελῶνος· 3 καὶ λαβόντες αὐτὸν ἔδειραν κ-α-ὶ ἀπέστειλαν κενόν.

4 καὶ πάλιν ἀπέστειλεν π-ρ-ὸ-ς α-ὕ-τ-ο-ῦ-ς ἄλλ-ο-ν δούλ-ο-ν· κἀκείνους ἐ-κ-ε-φ-α-λ-ί-ω-σ-α-ν καὶ ἡ-τί-μα-σ-α-ν. 5 καὶ ἄ-λ-λ-ο-ν ἀ-π-έ-σ-τ-ε-ι-λ-ε-ν· κἀ-κ-ε-ῖ-ν-ο-ν ἀ-π-έ-κ-τ-ε-ι-ν-α-ν, κ-α-ὶ π-ο-λ-λ-ο-ὺ-ς ἄ-λ-λ-ο-υ-ς, ο-ἵ-ς μὲν δ-έ-ρ-ο-ν-τ-ε-ς ο-ὗ-ς δὲ ἀπ-ο-κ-τ-έ-ν-ν-υ-ν-τ-ε-ς.

6 ἕ-τ-ι ἕ-ν-α ἐ-ἰ-χ-ε-ν υἱὸν ἀγαπητόν· ἀπέστειλεν α-ὕ-τ-ο-ν ἕ-σ-χ-α-τ-ο-ν πρὸς αὐτοὺς λέγων ὁ-τ-ι Ἐντραπήσονται τὸν υἱὸν μου. 7 ἐ-κ-ε-ῖ-ν-ο-ι (?) δὲ οἱ γεωργοὶ πρὸς ἑ-α-υ-τ-ο-ὺ-ς ἐ-ἰ-π-α-ν ὁ-τ-ι οὗτός ἐστιν ὁ κληρονόμος· δεῦτε ἀπο-κτείνωμεν αὐτόν, καὶ ἡμῶν ἔ-σ-τ-α-ι ἡ κληρονομία. 8 καὶ λαβόντες ἀπέκτειναν αὐτόν, καὶ ἐξέβαλον α-ὕ-τ-ο-ν (?) ἔξω τοῦ ἀμπελῶνος. 9 τί ποιήσει ὁ κύριος τοῦ ἀμπε-λῶνος; ἑ-λ-ε-ῖ-σ-ε-ται καὶ ἀπολέσει τοὺς γεωρ-γ-οὺς, καὶ δώσει τὸν ἀμπελῶνα ἄλλοις.

10 Οὐδ-ὲ τ-ὴ-ν γραφ-ή-ν τ-α-ὕ-τ-ῃ-ν ἀνέγνωτε, Λίθον δὲν ἀπε-δοκίμασαν οἱ οἰκοδομοῦντες, οὗτος ἐγενήθη εἰς κεφαλὴν γωνίας· 11 παρὰ Κυρίου ἐγένετο αὕτη καὶ ἔστιν θαυμαστή ἐν ὀφθαλμοῖς ἡμῶν;

It will be observed in the foregoing extracts<sup>1</sup> that (up to verse 11 of Mark), besides the matter common to all three writers, Mark and Luke have a good deal of additional matter in common (ἤρξατο, the dat. term. (καί)ϕ, ἵνα ἀπὸ, ἐξαπέστειλαν αὐτὸν κενόν, κἀκείνον, καὶ ἡτίμασαν, ἀγαπητόν, πρὸς, ἡμῶν, ἐλεύσεται καί, τοὺς γεωργοὺς); Mark and Matthew have also much additional matter in common (καὶ περιέθηκεν φραγμὸν καὶ ὠρυξεν (ὑπο)λήνιον) καὶ ὠκοδόμησεν πύργον, καὶ λαβόντες, πάλιν ἀπέστειλεν, ἄλλ(ον), ἀπέκτειναν, πρὸς αὐτοὺς λέγων, ἐαυ(οὺς), εἰπ(ο)ν, δεῦτε, λαβόντες, παρὰ κυρίου ἐγένετο αὕτη καὶ ἔστιν θαυμαστὴ ἐν ὀφθαλμοῖς ἡμῶν; but, in striking contrast, Matthew and Luke have no additional matter in common, except that in verse 3 of Mark they insert οἱ γεωργοὶ for clearness; in verse 7 they insert ἰδόντες; and in verse 9 they insert οὖν. Are these facts compatible with the theory that Mark compounded his narrative out of Matthew and Luke?

We may begin by dismissing the three trifling words which Matthew and Luke agree in adding to the Triple Tradition (by which we mean the matter common to the three Gospels), as being words that any early editor of Mark might naturally insert. The insertion of the subject in verse 3, for clearness, requires no comment. The οὖν in verse 9 softens an abruptness which (however characteristic of Mark) would naturally repel readers and editors. Again, in verse 7 the omission of some phrase to denote that the husbandmen saw the son approaching before they formed their plan, is so abrupt that ἰδόντες or θεασάμενοι has been actually supplied in Mark by several manuscripts and versions (possibly, of course, influenced by Matthew and Luke), and might naturally be supplied by still earlier editors. Having therefore accounted for these words, we are led to this result, that, from Mk. xii. 1 to Mk. xii. 11, Matthew and Luke contain nothing in common which is not also found in a slightly modified edition of Mark.<sup>2</sup> This being the case, it can be proved by *reductio ad absurdum* that Mark did not copy from Matthew and Luke. For suppose that he did so copy, it follows that he must not only have constructed a narrative based upon two others, borrowing here a piece from Matthew and here a piece from Luke, but that he must have deliberately determined to insert, and must have adapted his narrative so as to insert, every word that was common to Matthew and Luke. The difficulty of doing this is enormous, and will be patent to any one who will try to perform a similar literary feat himself. To embody the whole of even one document in a narrative of one's own, without copying it *verbatim*, and to do this in a free and natural manner, requires no little care. But to take two documents, to put them side by side and analyse their common matter, and then to write a narrative, graphic, abrupt, and in all respects the opposite of artificial, which shall contain every phrase and word that is common to both—this would be a *tour de force* even for a skilful literary forger of these days, and

may be dismissed as an impossibility for the writer of the Second Gospel.

For example, Mark might have begun his narrative, Καὶ ἔλεγεν αὐτοῖς, omitting παραβολήν; he might have borrowed οἰκοδεσπότης from Matthew and have dropped ἄνθρωπος; he might have borrowed πέμψαι from Luke (ver. 11) instead of ἀπέστειλε. Had he done these things (all natural enough), we should have at once had, as additional "common matter" for Matthew and Luke, παραβολήν, ἄνθρωπος, and ἀπέστειλεν, and all in the space of three verses, and "common matter" proportionally in the rest of the narrative. We may assume, therefore, that Mark did not copy Matthew and Luke in this passage, nor in other passages where a similar phenomenon occurs. But it occurs throughout by far the greater part of Mark's narrative. We may, therefore, regard it as absolutely certain that by far the greater part of Mark is not borrowed from Matthew and Luke and that the duality of phrase, which is undoubtedly a characteristic of Mark, must be explained by other causes (For other passages where Matthew and Luke have little or no additional matter in common, compare more especially the passages parallel to Mk. ii. 13-17; iii. 1-6; v. 1-39; x. 17-31; xi. 1-10; xii. 13-27; xiii. 1-19; xiv. 1-16; xv. 1-11.)

The question remains, Were Matthew and Luke entirely dependent upon Mark for that part of their narrative which covers the same ground as Mark? It would not be difficult, from a comparison of the three columns above, to make it probable that both Matthew and Luke did not borrow from the complete Mark as we have it. For though each of the three additions οὖν, ἰδόντες, οἱ γεωργοὶ, is in itself natural enough, yet the hypothesis that Matthew and Luke independently adopted precisely these and no other additions is most improbable. From a comparison of many such passages the improbability of the borrowing hypothesis might be increased. But as the process of proof could not be complete, and would certainly be long, it will be better to bring forward some short passages which are wholly irreconcilable with the hypothesis of deliberate borrowing, and which point to an original source, either written or oral, round which the three narratives play. Those passages will be most convincing where there are traces that some original tradition has been differently understood by the different writers.

- (a) One natural error in interpreting a terse tradition (perhaps translated from Aramaic into Greek) would be to supply different subjects to the same verbs, as in the following important passages, which variously describe the message of the angel or angels to the women at the tomb of Jesus:—

(1) Matt. xxviii. 7, *πρόαγει ὑμᾶς εἰς τὴν Γαλιλαίαν· ἐκεῖ αὐτὸν ὕψεσθε· ἰδοὺ, εἶπον ὑμῖν*—"behold, I have told you."

(2) Mk. xvi. 7, *πρόαγει ὑμᾶς εἰς τὴν Γαλιλαίαν· ἐκεῖ αὐτὸν ὕψεσθε, καθὼς εἶπεν ὑμῖν*—"as He told you."

On the other hand, Luke, who records several appearances of the Lord to the disciples in or near Jerusalem, and who does not take the Galilean view of the resurrection, finds the words *εἰς τὴν Γ.* out of place in his narrative. Yet his memory or knowledge of the common tradition is too strong to allow him to omit all mention of Galilee, and he therefore inserts it, but differently.

(3) Lu. xxiv. 6, *μνήσθητε ὡς ἐλάλησεν ὑμῖν ἔτι ὢν ἐν τῇ Γαλιλαίᾳ*—"remember how He spake unto you *while He was still in Galilee.*"

(B) (1) Matt. iii. 5, *ἐξεπορεύετο πρὸς αὐτὸν . . . πᾶσα ἡ περιχώρος τοῦ Ἰορδάνου.*

(2) Mk. i. 5 (agreeing here with Matthew), *ἐξεπορεύετο πρὸς αὐτὸν . . . πᾶσα ἡ Ἰουδαία χώρα.*

(3) Lu. iii. 3, *ἦλθεν εἰς πᾶσαν τὴν περιχώρον τοῦ Ἰορδάνου.*

(γ) In some cases the confusion is so important as seriously to affect the context, as in—

(1) Matt. xix. 16, *Διδάσκαλε, τί ἀγαθὸν ποιήσω*—which is

<sup>1</sup> The ordinary type on page 790 exhibits the words and phrases common to all three writers, which we will henceforth call the "Triple Tradition"; the underlined type that which is common to each pair (in addition to the matter common to the three); and the spaced type that which each writer has peculiar to himself alone. The black type in the first column represents that which (in addition to the matter common to the three) is common to Matthew and Mark; in the second column it represents that which is common to Luke and Matthew; in the third column, that which is common to Mark and Luke. It follows that the same words which are found as underlined type in the first, second, and third columns will be found as small black type in the second, third, and first columns respectively.

<sup>2</sup> The verse added in Matt. xxi. 44 is omitted by Tischendorf, and is perhaps not part of the text of Matthew. But, if genuine, it is a reference to the "winnowing-stone" in Daniel ii. 44, 45, which might naturally be added by some early editor of the original tradition, and might readily be adopted into the subsequent editions of it, which are known to us as the Gospels according to Matthew and Luke.

followed (in the correct text) by "Why askest thou me about the good?"

- (2) Mk. x. 17, *Διδάσκαλε ἀγαθέ, τί ποιήσω*—which is followed by "Why callest thou me good?"
- (3) Luke (xviii. 18) agrees with Mark: *Διδάσκαλε ἀγαθέ, τί ποιήσω*. Note that a scribe has endeavoured to combine the two traditions by inserting *ἀγαθέ* in Matt. xix. 16.

In the following the confusions are between only two narratives:—

- (δ) (1) Mk. iv. 19, *αἱ μέριμναι . . . εἰσπορευόμεναι συνπνίγουσι*—"cares, going into the heart, choke (the word)."
- (2) Lu. viii. 14, *ὅπῃ μεριμνῶν . . . παρενέμονται συνπνίγονται*—"the men) going their way (or gradually, as in LXX.), are choked by cares, or under the influence of cares."
- (ε) In the following, Matthew and Mark concur in attributing "desire" and "fear;" but Matthew attributes the "desire" to Herod, Mark to Herodias; again, Matthew makes the object of the "fear" to be the "crowd," Mark "John the Baptist."

- (1) Matt. xiv. 5, *Καὶ θέλων αὐτὸν ἀποκτείνειν ἐφοβήθη τὸν ὄχλον.*

- (2) Mk. vi. 19, *Ἦ δὲ Ἡρώδης . . . ἤθελεν αὐτὸν ἀποκτείνειν, καὶ οὐκ ἠδύνατο· ὁ γὰρ Ἡρώδης ἐφοβέτο τὸν Ἰωάννην.*

- (ζ) In a record of dialogue, the phrases, "said he," "answered they," would naturally vary (as they do, Matthew, Mark, and Luke having peculiarities in this respect), and they might sometimes be omitted, with the important result of transmuting a statement of fact (Mark) into an utterance of Jesus (Matthew), thus:—

- (1) Matt. xxvi. 2, *Οἴδατε ὅτι μετὰ δύο ἡμέρας τὸ πάσχα γίνεται.*

- (2) Mk. xiv. 1, *Ἦν δὲ τὸ πάσχα καὶ τὰ ἄζυμα μετὰ δύο ἡμέρας.*<sup>1</sup>

- (η) The following is another case of difference in the grammatical subject of the verb; the resemblance will appear demonstrative proof of confusion to those who compare the context, and who also remember that *ἀκολουθεῖν* is used habitually of others following Jesus, but not of Jesus following others.

- (1) Matt. ix. 19, *Καὶ ἐγερθεὶς ὁ Ἰησοῦς ἠκολούθει αὐτῷ.*

- (2) Mk. v. 24, *Καὶ ἀπῆλθεν μετ' αὐτοῦ, καὶ ἠκολούθει αὐτῷ ὄχλος πολὺς.*

- (θ) In the following there is a curious confusion from the omission of some words by Luke, so that what is the apodosis in Matthew becomes the protasis in Luke:—

- (1) Matt. xii. 26, *Καὶ εἰ ὁ Σατανᾶς [τὸν Σατανᾶν ἐκβάλλει], ἐφ' ἑαυτὸν ἐμερίσθη· πῶς [οὖν] σταθήσεται ἡ βασιλεία αὐτοῦ;*

- (2) Lu. xi. 18, *εἰ δὲ καὶ ὁ Σατανᾶς ἐφ' ἑαυτὸν διεμερίσθη, πῶς σταθήσεται ἡ βασιλεία αὐτοῦ;*

- (ι) The following suggests that some Aramaic word meaning to "question" and to "try" or "tempt" may have been diversely rendered by—

- (1) Matt. xii. 10, *Καὶ ἐπηρώτησαν αὐτόν, λέγοντες εἰ ἐξεστὶ θεραπεύειν.*

- (2) Lu. vi. 7, *Παρατηροῦντο δὲ αὐτὸν εἰ θεραπεύει.*

- (κ) (1) Matt. xxvii. 49, *Οἱ δὲ λοῖποι ἔλεγον, "Ἄφες, ἴδωμεν εἰ ἔρχεται Ἡλίας σώσων αὐτόν."*

- (2) Mk. x. 36, *λέγων, "Ἄφετε, ἴδωμεν εἰ ἔρχεται Ἡλίας καθελὼν αὐτόν."*

Here (1) in Matthew the bystanders address the man who brings the drink to Jesus; but (2) in Mark the man addresses the bystanders. In (1) the meaning is "desist from giving the drink;" in (2) it appears to be "desist from mocking." But in any case, the meaning differs in Matthew and Mark.

Many other instances might be given (e.g., Mat. xiv. 2; Mk. vi. 16; Lu. ix. 9; Mk. ix. 5; Lu. ix. 34); but we will conclude with one in which two traditional versions of a saying of our Lord, blended into one by Mark, appear to have caused a confusion: (a) "Every sin and blasphemy shall be remitted to men, but blasphemy against the Spirit shall not be remitted;" (b) "Whosoever speaketh a word against the Son of Man, it shall be remitted to him; but whosoever speaketh against the Holy Spirit, it shall not be remitted to him." Matthew gives both these versions, Luke one of them (with slight variations). But Mark,

combining the former part of the first version with the latter part of the second, so as to omit the phrase "Son of Man," and yet feeling that some mention of "Son of Man" was made in the tradition, substitutes for "men" "sons of men," a phrase that is not found elsewhere in the whole of the Gospels:—

- (λ) (1) Matt. xii. 31, 32, (a) [*διὰ τοῦτο λέγω ὑμῖν, πᾶσα ἁμαρτία καὶ βλασφημία ἀφεθήσεται τοῖς ἀνθρώποις, ἡ δὲ τοῦ πνεύματος βλασφημία οὐκ ἀφεθήσεται καὶ*] (b) *ὃς ἐὰν εἴπῃ λόγον κατὰ τοῦ υἱοῦ τοῦ ἀνθρώπου, ἀφεθήσεται αὐτῷ, ὃς δ' ἐὰν εἴπῃ κατὰ τοῦ πνεύματος τοῦ ἁγίου οὐκ ἀφεθήσεται αὐτῷ οὔτε ἐν τούτῳ τῷ αἰῶνι οὔτε ἐν τῷ μέλλοντι.*

- (2) Lu. xii. 10 (using *eis* for *κατὰ*, *εἰρεῖ* for *ἐν* *εἴπῃ*, and borrowing from (a) the word *βλασφημεῖν*), (b) *καὶ πᾶς ὃς ἐρεῖ λόγον τοῦ υἱοῦ τοῦ ἀνθρώπου ἀφεθήσεται αὐτῷ, τῷ δὲ εἰς τὸ ἅγιον πνεῦμα βλασφημήσαντι οὐκ ἀφεθήσεται.*

- (3) Mk. iii. 28, 29 (probably transposing *υἱός*, and using the dative instead of *κατὰ* or *εἰς*), (a) *λέγω ὑμῖν ὅτι πάντες ἀφεθήσεται τοῖς υἱοῖς τῶν ἀνθρώπων τὰ ἁμαρτήματα, καὶ αἱ βλασφημῖαι ὅσα ἐὰν βλασφημήσωσι;* (b) *ὃς δ' ἐὰν βλασφημήσῃ εἰς τὸ πνεῦμα τὸ ἅγιον οὐκ ἔχει ἄφεσιν εἰς τὸν αἰῶνα.*

Even those who may reject this explanation of the *ἀπαξ* λεγόμενον in Mark will probably feel that this passage, and all those previously quoted, point to some original tradition (whether written or oral) upon which our three synoptic Gospels are based. These then are the results to which (so far) we are led:—(1) Mark certainly did not borrow from Matthew and Luke; (2) Matthew and Luke, though clearly influenced by some form of Mark, yet probably borrowed, not from Mark, but from some original tradition upon which Mark also is based.

*The Nature of the Triple Tradition.*—What was the original tradition upon which our three synoptic Gospels are based? Was it Aramaic or Greek? oral or written? single or manifold? Did the earliest of our synoptists receive it fresh from its first source, or after it had passed through many recensions? Few or none of these questions (to some of which reference will be made hereafter) can be answered with absolute certainty; but it is evident that, if Matthew, Mark, and Luke are all based upon an earlier original tradition, then those words and phrases which are common to Matthew, Mark, and Luke (to which we have given the name of the Triple Tradition) must have a peculiar weight, as approximating to the original tradition itself. If it be found that these scattered words and phrases make up of themselves an almost continuous narrative, we may fairly suppose that we are approximating very closely indeed to the original tradition. We shall not expect to find a perfectly continuous narrative. On the contrary, a perfectly continuous narrative, identical in Matthew, Mark, and Luke, would imply, not a floating early variable tradition, but a document simply copied by the authors of our Gospels.

An early tradition, circulated perhaps in various churches, in Antioch, in Rome, in Ephesus, in Corinth, before being embodied in a document, will naturally have been modified, supplemented, and sometimes (as above) confused. More especially in certain unimportant and constantly recurring words and phrases we may expect variations. The words "said," "answered," "went," "journeyed," "asked," "questioned," "tempted," "refused," "rebuked," &c., may naturally be expected to differ in the three versions. But greater differences will soon arise. One version will lay greater stress on the details of miracles; another on the relations between Jesus and John the Baptist; another on the law; another on the forgiveness of sins; and this varying emphasis will produce certain modifications of the original tradition. Again, in the early times of the church, the Greek of slaves and freedmen may pass without offence; but in later times an editor of the Gospel, writing for readers of higher rank and better education, will

<sup>1</sup> Here, as elsewhere in this article, it has not been thought necessary to mention by name those critics whose statements are traversed. For a brief summary of the history of recent criticism on the Gospels, see the end of this article.

substitute less uncouth words for the original barbarisms. Thus, from varying causes, the different versions of the tradition will deviate; and when we come to compare three of them together, and to write down the words common to the three, we shall no longer find the original continuous tradition. Gaps in the sense will occur every now and then, owing to the omission of some necessary word. On the other hand, although the literary cement (so to speak) which fills up the interstices between the words and deeds of the Lord may naturally vary, we may expect that the words of the Lord Himself will be more carefully preserved, and more identically reported by all three synoptists, so that they will give a more continuous sense, and will enable us to approximate to the original tradition. Let us now take the Gospel of Mark, and set down, from the first two chapters of it, all such words as it contains in common with Matthew and Luke, merely adding in italics such words as may enable the reader to perceive the structure of each sentence; and let us see whether the words thus collected show any traces of a continuous narrative:—<sup>1</sup>

“*Esaias* | the prophet: || the voice of one crying in the wilderness, Prepare the way of the Lord, make His paths straight. | John | in the wilderness preaching | *repent*(t). | All | *went*(t) forth | to be baptiz(ed) by him. || There cometh one stronger than I | whose shoe-latchet [*Mat.* shoes] | I am not worthy to loose [*Mat.* bear]. | I baptiz(e) you with water, He | shall baptize you with the Holy Spirit. || *Jesu*(s) was baptiz(ed). || The heaven<sup>2</sup> | and the Spirit, as a dove, descend(ing) on Him. And a voice from | heaven | My beloved Son, in Thee [*Mat.* whom] I am well pleased. | The Spirit *drives* Him: | in the wilderness forty days tempt(ed) by [*Satan*; *In.* devil]. || *He came* into Galilee. || Com(eth) into the house of Simon [*Mat.* Peter]. | Stepmother *sick* of a fever. || And the fever left her; | she ministered to the(m). || He *heale*(d). || He *preache*(d) in the synagogu(es) of Galilee. || *There came* a leper | saying to Him, If Thou wilt, Thou canst make me clean. And stretching forth His hand, He touched him | I will, be thou clean. And immediately *there departed* from him the leprosy. || And *He said* to him, Tell no one, but | show thyself to the priest, and offer that which Moses ordained as a testimony to them.” Chap. ii. “|| And they brin(g) Hi(m) a paralyti(c). || And seeing their faith, || *He said*, Thy sins are forgiven(n). | The scribes *said*, This man blasphemeth(eth). || *Jesu*s said to the(m), | Why reason ye in your hearts? Which is easier, to say | Thy sins are forgiven(n), or to say, Rise(e) | and walk. But that ye may know that the Son of Man hath power on earth to forgive sins, *He said* to the paralyti(c), | Rise, take thy bed, | go to thy house. And | having taken it up, he went. || And they glorifi(ed) God. And *He saw* one sitting at the receipt of custom, and *said* to him, Follow Me, | and arising he followe(d) Him. | And he *feasted* Him in his house, and man(y) publican(s) | were feast(ing). || And the Pharisee(s) sai(d) to His disciple(s). W(hy) eat with publicans and sinners? | H(e) | *said* to them, They that are strong [*Lu.* healthy] have no need of a physician, but they that are sick. I cam(e) not to call the righteous but sinners. | The disciples of John | say to Hi(m): | The disciples of John and of the Pharisee(s) fas(t), but Thin(e) do not. *Jesu*s said to the(m), Ca(n) the son(s) of the bride-chamber fast? | The bridegroom is with them. || But the days shall come when the bridegroom shall be taken from them. Then shall they fast. | No one putteth on a | patch upon an old garment(t). No on(e) putte(th) new wine into old bottles. Else, it will burst(t) the bottle(s), and the wine will peris(h) and the bottles also. But new wine into new bottles. || On the Sabbath, *they were* going through corn-fields; His disciples plucke(d) the wheat-ears. | The Pharisee(s) *said*, They are doin(g) on the Sabbath(h) that which is not lawful. *He said* to the(m), Have ye not read what David did when he was an hungered, and they that were with him? how he went into the house of God, | and ate the shewbread, which(h) it is not law(ful) to eat, save for the priest(s)? || The Son of Man is Lord of the Sabbath.”

Few will have any difficulty in following the above narrative which represents the Triple Tradition of the synoptists. It will be generally admitted that, so far as it extends, it omits little of importance; and its con-

tinuity will commend it as likely to be, if not the original tradition, at all events a closer approximation to it than we are likely to find elsewhere. It therefore becomes an important business to consider the scope and variations of the Triple Tradition,—where it is full and ample, where it is meagre, where it begins and where it ends.

The commencement of the Triple Tradition has been given in the specimen quoted above. It begins with the proclamation made by John the Baptist, of the advent of the Stronger One. Describing (Mk. iii.) the cure of the withered hand, the choice of the Twelve, the discourse on blasphemy against the Holy Spirit, and the answer to the question, “Who is My mother and My brethren?” it passes (chap. iv.) to the parables of the sower and the mustard seed, which it gives very fully; the rebuking of the wind and the exorcism of the legion (Mk. v.) are given as follows:—

Mk. iv. 35. “*Let us go across* to the other side. *They took* Hi(m) | in a boat. || They wak(e) Hi(m) say(ing), We perish: and He, arising, rebuked the win(d). || And there was a calm. *He said* to them, | Your faith! || They said, Who is this that even the wind obey(eth) Him?” Mk. v. 1. “And they *came* across into the land of the [Gadarenes, Gerasenes, or Gergesenes]. There met Him | one [*Mat.* two] in the || tombs || crying, | What is there *between me* and Thee, Thou Son of God? || Torment me not. || And he [*Mat.* they] besought Him . . . into . . . || And He . . . them, | gom(g) forth, they come to (or into) the swine, and the herd rushed down the steep place into the sea [*Lu.* lake] and were choked [*Mat.* perished]. | Those that were feeding them | fled and brought word into the city. || They came || *Jesu*s. || And | *they besought* Him to depart from | them.”

This is given as a specimen of those passages where the narrative is not so continuous, and where there is some appearance of confusion. The evidence of confusion is confirmed (1) by the fact that a word is used here (*δαίμων*) to denote “spirit” or “demon,” which is not found once elsewhere in the whole of the Gospels, nor, indeed, anywhere in the New Testament (except in the Apocalypse twice), whereas *δαίμόνιον* is used forty-five times, and *πνεῦμα* twenty-seven times in the three Gospels alone; (2) by the difference of the names for the locality, Gadara, Gerasa, Gergesa; (3) by the fact that Matthew speaks of two demoniacs instead of one.<sup>3</sup>

The restoring to life of the daughter of a ruler (Mk. and Lu., ruler of a synagogue) is next thus briefly related: “*He came* into the house. | *She* is not dead, but sleepeth. And they mocked Him. || Having taken her by the hand | Arise.” Then follow (chap. vi.) the mission of the twelve, Herod’s conjecture about the new prophet, and the feeding of the five thousand, which runs thus (Mk. vi. 44):—

<sup>3</sup> It has been suggested (Abbott, *Through Nature to Christ*, p. 447) that this extremely difficult narrative may have arisen from a misunderstanding of the phenomena of possession. Compare the story in the *Evangelium Infantie Arabicum* (a Gospel which shows special traces of Mark’s influence) in which (chap. xi.) it is said of a certain demoniac that “demons, in the shape of crows and serpents, began to go forth, fleeing from out his mouth.” But it is perhaps more likely that the variation in the name of the place points to some misunderstanding as to the origin of the story. The name Gadara, ܓܕܪܐ, sometimes means a “sheepfold”; and *gaddar*, though not a Syriac word, is yet given in the Syriac lexicons as Hebrew for “flock.” Again, the correct reading in Mark is probably “Gerasene,” not “Gadarene”; and the word ܓܪܓܝܐ means “to cast out.” Lastly, the third reading, “Gergesa,” supported by Origen, is expressly said by that author (*Comm. in Ev. Joann.*, vi. 24) to mean “παροιμία ἐκ Βεβαρυκῶν,” “the district of those who cast out”; and he suggests that the name was probably prophetic, referring to our Lord’s expulsion from the district (ἐκ τῆς οἰκίας οὐρα τὰς ἀποφθιγμένας). Now, when a narrative of an event reported to have occurred at a certain place contains three different names of the place, and when each of the three names is adapted to the event, such a triple adaptation is obviously likely to be not a mere casual coincidence, but rather a convergence pointing to some misunderstanding or non-historical nucleus as the centre and origin of the narrative. What the misunderstanding was may be a matter of conjecture, but that there was some misunderstanding is a probability approaching to certainty.

"Send them away, that they may go into villages. | Give ye them to eat | *We have* five loaves and two fishes. || Having taken the five loaves and the two fishes, looking up to heaven, He blessed, and having broke(n) them, *He gave them to* the disciples. | And they all ate and were filled. | And they to(ok) up twelve bask(ets) of fragments. They were | five thousand men."

The walking on the waves is much more briefly recorded (Mk. vi. 46-51). "*He went to the mountain. | It was late. | They see Him walking on the sea. | It is I; be not afraid.*" Then follows a blank, in which Matthew and Mark generally agree, while Luke is altogether wanting; and, after this, the famous confession of Peter, followed closely by the transfiguration.

Mk. viii. 27. "He aske(d) them, | saying, | Whom | do they say that I am? They answered, | John the Baptist; | others Elias; but *others* a prophe(t). | He said, But whom do ye say that I am? Peter | answering said, Chris(t). Tell no one. *He said that He must needs | suffer many things | from the elders and chief priests and scribes, and be slain, and after three days [or, on the third day] He must be raised up [Mk. ἀναστῆναι, Lu. and Mat. ἐγερθῆναι.] | If any one wishes to come after Me, let him deny himself, and take up his cross and follow Me. For whosoever wishes to save his life shall lose it, but whosoever los(eth) his life for My sake shall save it. For what is a man profit(ed), to gai(n) the whole world, and be lost? | The Son of Man shall come in glory, with the angels."* || Mk. ix. "I say unto you, There are some of those stand(ing) here who shall not taste death till they see th(e) kingdo(m). | After six [Lu. eight] day(s) he take(th) | Peter and James and John | into a mountain. | His garment(s) become white. | And there appear(ed) Elias and Moses speak(ing) with Him. | Peter said to Jesu(s), It is good for us to be here; let us mak(e) three tabernacles, one for thee, and one for Moses, and one for Elias. | A cloud overshadow(ed) the(m), and there was a voice from the cloud, This is My Son: hear Him. | They saw Jesus alone."

From Mark ix. 14 to x. 16 there is a break in the common tradition, which here records little except three or four sayings of the Lord.

"O faithless generation, how long shall I be with you?" "The Son of Man is to be betrayed into the hands of men." "Whosoever receiveth a child in My name receiveth Me." "If any one cause one of these little ones to stumble, a mill-stone round his neck, and let him be cast into the se(a)." "Salt is good, but if the salt lose its savour, wherewith shall it be salted?" "Suffer the children; forbid them not; for of such is the kingdom."

In contrast to this discontinuity, Mark x. 17-52 gives a continuous tradition about the rich young man, the promise of reward to the disciples, the predictions of betrayal, and the healing of the blind man near Jericho. The entry into Jerusalem and the purification of the temple (xi. 1-17) are also fairly continuous. The disputes in the temple touching the baptism of John (xi. 27-33), the wicked husbandmen (xii. 1-12), and the tribute-money (xii. 13-17) are very continuous. A brief denunciation of the Pharisees, who love the first seats in synagogues and at feasts, is found in Mark xii. 38-40. The Triple Tradition then touches on the second coming of Jesus. Luke has here omitted many important passages which are recorded by Matthew and Mark alone, and which will be given hereafter (see p. 795). Here we will set down nothing but the common tradition, marking Luke's omissions.

Mk. xiii. 1. "And | He said. || Not a stone shall be left on stone, which shall not be cast down. || They asked Him, || When shall these things be? And what is the sign? He answered, Take heed lest any deceiv(e) you. Many shall come in My name saying, I am He. || When ye hea(r) of wars, be not alarmed [Lu. substitutes the usual LXX. word πονηθήτε for the LXX. ἀπαλ λυόμενον, θροεῖσθε, which is in Mat. and Mk.]. These things must needs come to pass, but the end is not yet. Nation shall rise against nation, and kingdom against kingdom. There shall be earthquakes in places, there shall be famines. || They shall deliver you to . . . for a witness . . . || And ye shall be hated by all men for My name's sake, but he that remain(eth) shall be saved. When ye see | desolat(ion), then let them that are in Judaea flee to the mountains. || He that is on the house-top let him not descend, | and he that is in the field let him not turn back.<sup>1</sup> || But woe to

them that are with child, and to them that give suck in those days." [Here Luke leaves a blank in which Matthew and Mark predict "false Christs" and "the darkening of the sun."] "And the powers of (or in) the heavens shall be shaken. And then shall they see the Son of Man coming in the cloud(s) with great power and glory. || From the fig-tree ye know that the summer is near. So also ye, when ye see these things. || Heaven and earth shall pass away; but My words shall never pass away."

In Matthew and Mark there follows the avowal that "of that day or hour none knoweth, not even the angels in heaven, nor even the Son, but only the Father." But Luke omits this. The Triple Tradition passes to the betrayal of Jesus. The traitor's compact (Mk. xiv. 10, 11) and the visit to the city to eat the Passover are briefly narrated. From this point the Triple Tradition becomes more and more scanty, till it leaves us at last little more than a few disconnected sayings of Jesus.

Mk. xiv. 21. "The Son of Man goeth indeed, as it is written; but woe to that man by whom He is to be betrayed. || Having taken bread, He brake it, and ga(ve) it. | This is My body. And taking the cup, This is My blood of the testamen(t), that is shed . . . || I say unto you, I will never drink of the fruit of the vine until the kingdom. || And | they wen(t) forth to the Mount of Olives. || I say unto thee, Before the cock crow, thou shalt deny Me thrice. || He pray(ed), If it be possible . . . || He sai(d), Fath(er), take this cup from Me; || yet not as I wil(l), but as Thou wilt. || And having foun(d) them sleeping, He said, Pray, that ye enter not into temptation. || While He was still speaking, came Judas, | one of the twelve, | and a multitud(e) with him. || He kiss(ed) Him. || One smote [Mk. ἔπαυσε, for which Mat. and Lu. substitute the more appropriate and common word ἐπάραξε] the servant of the high priest, and cut off his ea(r). | Jesus said, As against a thief have ye com(e) out with swords and staves? I was daily | in the temple; and ye took Me not. || They led Him to th(e) high pries(t). || Peter followe(d) afar off | and sat in | the hall. Art thou the Son of God [Mk. the Blessed]? || Thou shalt see the Son of Man seated on the right hand of the Power. || What need have we yet of witnesses? || They sai(d) unto Him, Prophesy. || A maid-servan(t) spake unto Peter(r). || But he denied, saying, I do not know Him. || Verily thou art one of them, for . . . || And Peter remembered, Before the cock crow, thou shalt deny Me thrice, and he wep(t)."

Mk. xv. "They led Him to Pilat(e). || He aske(d) Him, | Art Thou the King of the Jews? He said to him, Thou sayest || . . . Barabbas . . . || Crucify Him. Why, what evil hath He done? Crucify Him. | Pilate released Barabbas, and delivered over Jesus. || And they le(a)d Him away. || They made Simon a Cyrenian carry the cross. || They came to the place of the Skull. || They divide(d) His garments and cast lots. || There was written up, The King of the Jews. || On the right hand and on the left . . . || He saved others; let Him save (Himself). || About the sixth(h) hou(r) there was darkness over the earth until the ninth hour. || Jesus with a loud voice emitted His breath. || And the women | who in [or from] Galilee had followed Him beheld(d) [Mk. and Mat. θεωρεῖν, Lu. ὁρᾶν, reserving θεωρεῖν for v. 55] these things from afar. || Joseph of Arimathæa | cam(e) to Pilate and begged the body of Jesus, || and wound [Mk. ἐνέλιπον; Mat. and Lu. ἐνέταλλεν] it in linen | and laid it in a tomb."

At this point the tradition not only becomes discontinuous, but also shows marks of confusion. The tradition appears to have been that the women "beheld," or came to "behold" (another tradition added at "dawn"), and came to the tomb; but what "dawn" is meant, and what was the object of their beholding, is left uncertain.

(1) Matt. xxvii. 61; xxviii. 1. "There were there Mary Magdalene and the other Mary sitting over against the tomb. Late in the Sabbath, at the hour of dawning (τῇ ἐπιφωσκούσῃ), before the first day of the week, came Mary Magdalene and Mary to behold (θεωρῆσαι) the tomb (τάφον)."

(2) Mk. xv. 47; xvi. 1. "Mary Magdalene and Mary the mother of Joseph beheld (ἐθεώρουν) where He was laid (τέθειται). When the Sabbath was passed, Mary Magdalene and Mary the mother of James and Salome brought spices that they might come and anoint Him."

(3) Lu. xxiii. 54. "And the Sabbath was dawning (ἐπιφώσκει); and having followed Him (to the grave), the women who had come with Him from Galilee beheld (ἐθεώσαντο) the tomb, and how His body was laid (τέθειται), and returning they brought spices."

<sup>1</sup> This passage is found in Matthew and Mark here, but in Luke elsewhere (xvii. 32).

<sup>2</sup> It may be observed that the same Syriac word is used to denote evening as well as morning twilight. See Gildemeister, *De Evangeliiis in Arabicum et simplicior Syriaca translatis*, Bonn, 1865, p. 20.

The only remaining words of the tradition are: "... the first day of the week . . . roll(ed) away [i. e., the stone at the opening of the tomb] . . . He is not here; He is risen . . . Galilee . . . they fled from the tomb." Matthew and Mark continue for a few lines a narrative based upon some common tradition; but even here there occurs the confusion mentioned above—Mark, "as *He* told you;" Matthew, "behold, *I* told you;" and the narrative of Mark ends at xvi. 9. The remaining verses of Mark are an appendix added by some later editor; and henceforth the narratives of Matthew and Luke—having lost Mark—present no further traces of agreement.

To sum up the contents of the common tradition, it omits the genealogies, miraculous incarnation, and the picturesque details of the infancy; it lays emphasis on the relations between John the Baptist and Jesus; it contains none of the parables except the sower, the mustard seed, and the wicked husbandmen, and few of the long discourses of Jesus, except an abridged prediction of the second coming. The disputes between Jesus and the Pharisees about the Sabbath, about fasting, about exorcism, about the baptism of John, and the tribute, and Christ the Son of David, and the dialogue with the Sadducees about the resurrection, are very fully given; and so also is the dialogue with the rich young man. Indeed it is a collection of dialogues and anecdotes rather than a set treatise of doctrine or biography. The sayings of Jesus recorded in it are short, pithy, and abrupt,<sup>1</sup> and many of them are polemical. Only now and then do we find a sentence which goes down deep below all polemics, and reveals a deep-laid spiritual plan. But putting such sentences together we perceive that the Triple Tradition describes a prophet wholly different from any that had before appeared in Israel; a prophet who not only (like Isaiah) protested against sabbaths and purifications as ends in themselves, but who also preached the Fatherhood of God in a manner entirely peculiar to Himself, and who set aside the Mosaic law of divorce (Mk. x. 2-11). He also instructed His disciples to enter into the kingdom as little children (x. 15), and seems to have attached a certain symbolic mystery to childhood as representing Himself (ix. 37). He taught His disciples further to devote their lives to Him, and to ignore all life apart from Him (viii. 34), ("to confess Christ, to deny themselves"). From the first He claims the power of forgiving sins (ii. 7); and, as soon as one of His disciples confessed Him to be the Messiah, He prepared for death, predicting that He should die, but rise again. Then, after prophesying the fall of the temple, and great distress in all nations, He predicted a final triumph for His disciples; and after bequeathing Himself, His body and His blood, as at a funeral feast, as His final legacy to His disciples, He was arrested and put to death.

Several miracles of healing are recorded, and, in addition to these, the exorcism of the Gadarene (in which, however, great confusion is apparent), the stilling of the storm, the feeding of the five thousand, and the transfiguration. From the beginning of the discourse on the second coming, Luke diverges more and more from Matthew and Mark. After the death of Jesus, Matthew and Mark continue to agree in words and phrases, but a little confusion is apparent; and the tradition suddenly terminates without any record of the appearance of Jesus to His disciples. However we may regret this, it is perhaps what may be naturally expected on the hypothesis that we have before us an early tradition originated at a time when the numerous manifestations of Jesus after His death were still attested by living witnesses; when as yet it had been

found impossible to reduce the experiences and impressions of those who had seen Him—impressions necessarily variable and transient, blended with fear and with an excitement bordering on ecstasy—to a consistent and historical shape; and when it had not yet been found necessary to define and harden the narrative so as to adapt it for the purpose of meeting doubts and objections.

*The Additions common to Matthew and Mark.*—The Additions common to the Triple Tradition which are found in Matthew and Mark, but not in Luke, are the following:—

- (1) The description of John the Baptist (Mat. iii. 4; Mk. i. 6);
- (2) the ministering of the angels (Mat. iv. 11; Mk. i. 13);
- (3) the calling of the fishermen (Mat. iv. 18-22; Mk. i. 14-20);
- (4) the murmuring of His friends at Nazareth (Mat. xiii. 53-57; Mk. vi. 1-4);
- (5) the influence of Herodias in procuring John's execution (Mat. xiv. 8-13; Mk. vi. 25-29);
- (6) the walking on the water (Mat. xiv. 22-28; Mk. vi. 45-51);
- (7) the disputes with the scribes from Jerusalem (Mat. xv. 1-20; Mk. vii. 1-23);
- (8) the story of the Syro-Phœnician woman, which is narrated by Matthew and Mark in widely divergent language, but with an almost identical conclusion (Mat. xv. 21-28; Mk. vii. 24-30);
- (9) the feeding of the four thousand (Mat. xv. 32-38; Mk. viii. 1-9), and the comparison between this miracle and that of the five thousand (Mat. xvi. 5-12; Mk. viii. 14-21);
- (10) the saying of Jesus that Elias had already come (Mat. xvii. 12; Mk. ix. 13);
- (11) the discussion of the enactments of Moses concerning divorce (Mat. xix. 4-8; Mk. x. 2-9);
- (12) the saying (but Luke inserts it elsewhere) that "many that are first shall be last" (Mat. xix. 30; Mk. x. 31);
- (13) the petition of the sons of Zebedee for the chief places (Mat. xx. 20-28; Mk. x. 35-45);
- (14) the withering of the fig-tree (Mat. xxi. 18-22; Mk. xi. 13, 14, 20);
- (15) the introductory question of the lawyer, "Which is the great commandment" (Mat. xxii. 36; Mk. xii. 28);
- (16) in the discourse on the last day, Luke omits reference to the "consummation," *συντέλεια* (Mat.), *συντελεῖσθαι* (Mk.); "these things are the beginning of troubles," "the abomination of desolation," &c.; "he that readeth let him understand;" "pray that your flight may not be in winter;" "(tribulation) such as was not from the beginning till now, nor ever shall be;" the expression about the "shortening" of the days "for the elects' sake;" "He shall send His angels, and gather together the elect;" "of this hour the Son knoweth not;"
- (17) later on, Luke omits the anointing of Jesus "for His burial" (Mat. xxvi. 6-13; Mk. xiv. 8-9);
- (18) "I will smite the Shepherd," &c., and "I will go before you into Galilee" (Mat. xxvi. 31, 32; Mk. xiv. 27, 28);
- (19) the compact of Judas with the priests that a kiss should be the signal (Mat. xxvi. 48; Mk. xiv. 44);
- (20) the false witness about "destroying the temple in three days" (Mat. xxvi. 59, 62; Mk. xiv. 55-60);
- (21) the taunt "Thou that destroyest the temple" (Mat. xxvii. 40; Mk. xv. 29);
- (22) the utterance of Jesus, "My God, My God, why hast Thou forsaken Me?" with the consequent misunderstanding of the bystanders (Mat. xxvii. 46-49; Mk. xv. 34-36);
- (23) the utterance of the angel (or angels) at the tomb, "He goeth before you into Galilee: there shall ye see Him" (Mat. xxviii. 7; Mk. xvi. 7).

In considering these passages it is natural to ask whether any reason (besides ignorance of them) can be alleged why Luke should have omitted them. It is scarcely possible to fail to see design in some of these omissions,—for example, in those which relate to John the Baptist and Elias (1), (5), and (10). The author of the Acts of the Apostles is by general consent admitted to be identical with the author of the Third Gospel. Now remembering that Luke in the Acts (xix. 3) informs us that, many years after the death of Jesus, there were in Ephesus several disciples who were baptized with the baptism of John, and knew nothing of the Holy Spirit, we may well understand that the author of the Acts finds it necessary, when writing a gospel, to put in as clear a light as possible the subordination of John to Jesus. Accordingly, in place of the graphic description of the austere food and garb of the prophet, he gives (iii. 10-14) a description of his teaching, as containing the elements of a simple and almost commonplace morality, intended merely to prepare the way for a higher teaching, and he adds an express negative from the prophet in answer to those who doubted whether John were the Messiah. Repeatedly does Luke deviate from the common tradition of Matthew and Mark on the subject of

<sup>1</sup> Cf. Justin, *Apol. I.* (Kirchhofer, p. 89), *Βραχεῖς τε καὶ σύντομοι παρ' αὐτοῦ λόγοι γεγόνασι.*

Elias; and in each case the object is apparent. Only a close inspection of a harmony of the Gospels will make this clear; but three or four passages may be mentioned which point in this direction. Luke has already (i. 17) declared that John will go before Jesus "in the spirit and power" of Elias, but he cautiously avoids committing himself to the tradition (Mk. ix. 13; Mat. xvii. 13) that John was Elias. The belief in an actual transmigration of souls he will allow the multitude to entertain (ix. 8, 19), but not Herod: for whereas in Mark (vi. 16) Herod says, "Whom I beheaded, viz., John, this man (*οὗτος*, corr. text), is risen from the dead," Luke, by a slight transposition of the traditional words, converts the proposition into a question: "John I beheaded; but who is this man?" And, further, in order to prepare the way for the interview between Herod and the Lord—which he purposes to describe at the end of his Gospel (xxiii. 8, 9), and to refer to in his continuation of the Gospel (Acts iv. 27)—he adds the words, "And he (Herod) was desirous to see Him." Again Mark (ix. 6) tells us that Peter "not knowing *what to answer*," proposed to build three tabernacles for Jesus, Moses, and Elias; but Luke reads (ix. 33), "not knowing *what he said*," as if to caution the reader against supposing that Elias or Moses could be seriously placed on the same level as Jesus. For the same reason he omits the irreverent misunderstanding of the bystander who supposed that Jesus in his last moments called for Elias, and even the utterance itself (Mat. xxvii. 49; Mk. xv. 36).

**Luke's omissions.** With reference to many of the other omissions it will be noticed that Luke seems to have before him somewhat different versions of the narratives, which different versions he inserts elsewhere. For example, he gives a version of the calling of the apostle-fishermen, which adds a miraculous draught of fishes, thereby approximating to the narrative in the Fourth Gospel (xxi. 6-11). Again Luke places the murmuring of the Nazarenes much earlier, in the fore-front of the ministry of Jesus, as was very natural, and gives an entirely different version of it. The ministry of the angels after the temptation he omits; but he alone records the ministry of the angel (xxii. 43) when Jesus was tempted in Gethsemane, for which temptation he carefully prepares the way by saying (iv. 13) that the devil departed from Jesus only "for a season." As regards the anointing "for the burial," it is probable we have a different version of it in his story of the woman that was "a sinner" (vii. 37). The reasons for the omission of the feeding of the four thousand and the withering of the fig-tree are not so obvious. The omission could hardly have been dictated by any desire to minimize the supernatural (seeing that Luke contains many miracles peculiar to himself, and that he does not shrink from giving in full detail the exorcism of the Gadarene). It is possible that he omitted the former as being too similar to the feeding of the five thousand to require to be repeated; and if he regarded it (as the author of the Fourth Gospel does) as having a sacramental meaning, one story of the kind may have seemed sufficient. If the story of the withered fig-tree was regarded by him in the same way (rather as emblematic than as historical), then it may have been replaced in his narrative by the story of the barren fig-tree (peculiar to Luke), to which the master came seeking fruit and finding none. It is also noticeable that the moral (on the power of faith) deduced from the withering of the fig-tree in Matthew and Mark is contained in Luke, but in a different form. In Matthew and Mark it runs: "If ye say to this *mountain*, Be raised up and cast into the sea; whereas in Luke (xvii. 6) it is, "Ye might have said to this *sycamine tree*, Be rooted up and planted in the sea." This perhaps slightly confirms the supposition that Luke regarded the

narrative of the fig-tree rather as a parable than as a fact. But it is important to bear in mind that we have little more than the evidence of conjecture to explain some of Luke's omissions. For example, the story of the walking on the waves, as told by Matthew and Mark, represents the disciples as being alarmed by the thought that the apparition of the Lord was only a spirit (*φάντασμα*); unless Luke considered that the ground of this narrative was occupied by his account of a similar fear when the disciples beheld the Lord after the resurrection, it is hard to suggest any reason for its omission. This class of omissions may be terminated with that numbered (19) above—the compact of Judas concerning the signal. It is obvious here that Luke has another version of the tradition in his mind. He alone of the three records the words of Jesus, "Betrayest thou the Son of Man with a kiss," thereby making it unnecessary to explain (with Matthew and Mark) that the kiss was a signal fixed by the traitor.

Another class of passages may possibly have been omitted as being not of interest to the Gentile world, or as being liable to misunderstanding or perversion. The story of the Syro-Phœnician woman perhaps appeared to the editor of the Gentile Gospel to exhibit Jesus in too harsh a light; the application to Jesus of the prophecy "I will smite the Shepherd," appeared more liable to misunderstanding than "He was reckoned with transgressors" (not found in Mark's genuine text); the discussion of the law of divorce and of the regulations touching uncleanness, and the part played by Herodias in the execution of the Baptist, may have seemed to lack interest for readers outside Palestine. In the discourse on the second coming it would be natural for an editor of the tradition writing after the siege of Jerusalem to substitute "encircled by armies" for the "abomination of desolation"—a phrase that would perplex a Gentile reader, and also to modify some of the hyperbolic and emblematic expressions. Lastly, the mention of the "false witness" concerning the destruction of the temple, and the raising up of a new temple in three days, may have begun to present a difficulty in times when the temple actually had been destroyed, and when the Lord Jesus Himself had come to be regarded as the new temple not made with hands. Although therefore Luke does not go so far as the author of the Fourth Gospel (who exhibits Jesus as actually predicting the destruction of the temple and as promising to raise it up in three days), yet he not only omits the "false witness," but also the allusion to it contained in the taunts addressed to Jesus on the cross, "Thou that destroyest the temple and raisest it again in three days, save Thyself" (Mat. xxvii. 40; Mk. xv. 29).

The above explanation of Luke's omissions may only partially commend itself to the reader; but few will fail to see that there is at least some method and motive in most of them. It is a matter of certainty that in the Triple Tradition many of Luke's omissions and modifications of phrases and words are not accidental but editorial: it is but natural therefore to suppose (especially when reasons can easily be assigned) that editorial reasons may also explain omissions and modifications of narratives and discourses. Of course it is not maintained that Luke, or any individual editor, made these changes on his own responsibility. Many of them are probably the result of a "Gentile use" which had gradually sprung up in certain churches, and which was not created but adopted and expressed by the author of the Third Gospel. Consequently we are not obliged to suppose that the omissions resulted from ignorance. The very fact that it is easy to supply motives and reasons for the omission of these narratives increases their credibility, by diminishing the probability

that they were late traditions unknown to the author of the Third Gospel. The passages omitted are generally in the style of the common tradition, and they contain incidents of a similar kind to the incidents of the common tradition. It only remains to add that (except in the story of the Syro-Phœnician woman, and, in a lesser degree, in the question of the lawyer about the great commandment) Matthew and Mark closely agree whenever Luke separates himself from them. This is also found frequently to be the case in the Triple Tradition.<sup>1</sup> In the midst of very similar context, if Mark is identical, or nearly so, with Matthew, in the expression of some action, it will be found that Luke often suddenly diverges, or makes some omission. Thus—

(1) Mat. xxi. 12. Καὶ εἰσῆλθεν Ἰησοῦς εἰς τὸ ἱερόν καὶ ἐξέβαλε πάντας τοὺς πωλοῦντας καὶ ἀγοράζοντας ἐν τῷ ἱερῷ, καὶ τὰς τραπέζας τῶν κολλυβιστῶν κατέστρεψε, καὶ τὰς καθέδρας τῶν πωλούντων τὰς περιστρεφάς.

(2) Mk. xi. 15. Καὶ εἰσελθὼν εἰς τὸ ἱερόν, ἤρξατο ἐκβάλλειν τοὺς πωλοῦντας καὶ τοὺς ἀγοράζοντας ἐν τῷ ἱερῷ καὶ τὰς τραπέζας τῶν κολλυβιστῶν, καὶ τὰς καθέδρας τῶν πωλούντων τὰς περιστρεφάς κατέστρεψε.

(3) Lu. xix. 45. Καὶ εἰσελθὼν εἰς τὸ ἱερόν, ἤρξατο ἐκβάλλειν τοὺς πωλοῦντας, omitting the rest.

So, in the midst of the story of the rich young man, where Matthew and Mark have ἀπῆλθε λυπούμενος, ἦν γὰρ ἔχων κτήματα πολλά, Luke, suddenly diverging, has περὶ λυπτὸς ἐγενήθη· ἦν γὰρ πλούσιος σφόδρα (Mk. x. 22; Mat. xix. 22; Lu. xviii. 23). Sometimes the divergence appears to arise from literary motives, and especially from the dislike of repetition (Lu. iv. 32; Mat. vii. 29; Mk. i. 22); but in other cases it cannot be so explained:—Lu. v. 29, 30; Mat. ix. 10, 11; Mk. ii. 15, 16: Lu. v. 33, 34; Mat. ix. 14, 15; Mk. ii. 18, 19 (see also, in a parable, Lu. v. 36; Mat. ix. 16; Mk. ii. 21): Lu. vi. 11; Mat. xii. 14; Mk. iii. 6: Lu. viii. 13; Mat. xiii. 21; Mk. iv. 17: Lu. viii. 44; Mat. ix. 21; Mk. v. 29. In some of these cases the agreement between Matthew and Mark is so close as to suggest that both writers may have used some common document (not oral tradition) which contained little more than certain words of the Lord in a scanty framework of narrative. But this common matter adds little to our knowledge of Christ. The most important narrative in it is the story of the Syro-Phœnician, showing how Jesus, as it were, acknowledged in the woman's persistent faith a divine revelation, extending His gospel even to the heathen. And this narrative is written in language so divergent as to indicate not a document but an oral tradition.

**Additions of Mark and Luke.** *The Additions of Mark and Luke.*—Additions of any length are very few:—

(1) An exorcism of an unclean spirit (Mk. i. 21-25; Lu. iv. 31-35); (2) the account of Jesus retiring to a solitary place, when He declares that He must carry the gospel elsewhere (Mk. i. 35-39; Lu. iv. 42-44); (3) the saying of John the son of Zebedee, "Master, we saw one casting out devils in Thy name, and we forbade him," and the reply of Jesus (Mk. ix. 38-40; Lu. ix. 49, 50); (4) the short denunciation of the Pharisees that devour widows' houses (Mk. xii. 38-40; Lu. xx. 46, 47); (5) the story of the widow's mite (Mk. xii. 41-44; Lu. xxi. 1-4). Shorter similarities are—(6) a mention of Jesus as being in retirement (Mk. i. 45; Lu. v. 16); and (7) a mention of "Tyre and Sidon" as places to which the fame of Jesus had spread (Mk. iii. 8; Lu. vi. 17). There is a close verbal agreement between Mark and Luke in the exorcism of the "legion" (a name that does not occur in Mark); in the raising of the daughter of Jairus; and in the stilling of the storm. But gradually as Matthew approximates to Mark, Luke deviates from Mark. There is a return to similarity in the preparation for the Passover (Mk. xiv. 12-16; Lu. xxii. 7-13); but from this point Luke deviates more and more, and, with the exception of two words (σάβας and φόνος) in the incident of Barabbas, and of a somewhat closer approximation in the incident of Joseph of Arimathea, it may be almost said that Luke has

henceforth nothing in common with Mark, except what is found in the Triple Tradition.

Most of the incidents common to Mark and Luke are so few and so simple that their omission by Matthew requires no explanation. It is possible that the names Jairus and Legion did not exist in the earliest tradition, as it presented itself to Matthew; the "authority" which Mark illustrates (compare i. 22 with i. 27) by exorcism, Matthew applies (and perhaps justly) rather to our Lord's method of teaching (vii. 28, 29); but it is difficult to suppose that any other cause than ignorance could have caused the omission of the saying of Jesus concerning the widow's mite. It is certain that, in some at least of these passages, Mark represents the earlier, and Luke a modified tradition. Luke (see below, p. 806), writing with a literary purpose, has softened many early irregularities, which in Mark retain their original harshness. For example, the ungrammatical οἱ κατέσθοντες (Mk. xii. 40) is altered (Tischendorf and Tregelles, *pace* Lachmann) into οἱ κατεσθίουσι (Lu. xx. 47); and instead of θελόντων before ἀσπασμούς (Mk. xii. 38) Luke inserts φιλοῦντων (Lu. xx. 46). In the story of the widow also, Luke, disapproving of the epithet "beggar" (πτωχή) applied to the poor widow, substitutes the more respectable *πενιχρά*, yet with a natural but inconsistent reverence declines to cancel the same epithet (πτωχή) when (Lu. xxi. 3) it occurs in the words of the Lord. The rarer and less correct (ambiguous also when followed by the feminine αὐτῆς) ὑστερήσεως (Mk. xii. 44) is altered into ὑστερήματος (Lu. xxi. 4); and, lastly, the lengthy duality of Mark, "as many things as she had; all her livelihood" (which looks as if it had arisen from combining two different renderings of the same Aramaic original), is condensed by Luke (who takes one part of one rendering, and another part of the other) into "all the livelihood that she had." It is probable that not only in these but in all passages common to Mark and Luke alone, wherever Mark and Luke differ, Mark represents an earlier, and Luke a later version of the original. And generally it may be said that Luke follows the tradition of Mark most faithfully when it deals with Galilee, and least when it deals with Jerusalem.

*Additions common to Matthew and Luke.*—These introduce an altogether new element into the tradition. Hitherto the Triple Tradition of Matthew, Mark, and Luke (as well as the double tradition of Matthew and Mark, and of Luke and Mark) has consisted mostly of short "words of the Lord," set in a framework of short narratives, and very seldom agreeing exactly for more than seven or eight consecutive words. But we now come upon "words of the Lord" in Matthew and Luke, some of which agree exactly for several sentences. What was the origin of this close agreement? In order to gain some view of the data for solving this problem, we must briefly consider the principal passages common to Matthew and Luke alone.

The temptation (Mat. iv. 1-10; Lu. iv. 1-12) and the healing of the centurion's servant (Mat. viii. 1-13; Lu. vii. 1-10) are the principal narratives of *fact* common to Matthew and Luke alone. They resemble the narratives of the Triple Tradition in agreeing so far as concerns the words of Jesus, and of those who address Him, much more than in the general narrative. In the narrative of *facts*, the story of the centurion in Luke differs altogether from that in Matthew; in the temptation, the difference is less. Dismissing these, we pass to the "words of the Lord." As Luke's avowed object was to write "in order," we will adhere to his arrangement in our enumeration.

(1) Mat. iii. 8-10; Lu. iii. 8, 9. "Generation of vipers," &c.; this agrees *verbatim*, except that Luke has ἀρεσθῆς, where Matthew has δόξητε.

<sup>1</sup> In the words of the Lord the three Gospels are often closely similar, but seldom in the deeds.

(2) After a break in which (Mk. intervening) Matthew and Luke have no more than a general agreement with Mark and one another, we come to another passage describing the purifying of the threshing-floor with fire unquenchable (Mat. iii. 12; Lu. iii. 17); the two agree *verbatim*.

(3) Mat. v., vi., vii.; Lu. vi. Here are some scattered sayings of the Sermon on the Mount, such as, "Blessed are the poor," "the hungry," &c. In these the agreement is not *verbatim*. The only passage that agrees almost *verbatim* is that about the mote and the beam.<sup>1</sup>

(4) Mat. xii. 35; Lu. vi. 45. "The good man out of the good treasure of his heart," &c., nearly *verbatim*, but curiously transposed to suit the differing context.

(5) Mat. xi. 2-11; Lu. vii. 19-28. John the Baptist sends two of his disciples to say, "Art thou He that is to come?" With the exception that Luke (a) introduces some cures wrought by our Lord, for the special purpose of convincing John's disciples, and (b) avoids the repetition of *ἐν μαλακοῖς ὑποπόδημα* by using *ἐν ὑμῶνισμα* *ἐνδόξῳ*, this passage shows an agreement almost *verbatim*.

(6) Mat. xi. 16-19; Lu. vii. 31-35. "We have piped unto you, and ye have not danced," &c., almost *verbatim*, except that Matthew has *ἐκόψασθε*, Luke *ἐκλαύσατε*.

(7) Mat. (a) ix. 37, 38, and (b) x. 16; Lu. (a) x. 2, and (b) x. 3. (a) "The harvest truly is great," &c.; (b) "I send you as sheep among wolves." The agreement, though not *verbatim*, is considerable. But note (a) that Matthew takes the prayer for the increase of the labourers, as a preface to the choice of the twelve, while Luke places it after the choice of the twelve, and uses it as a preface to the choice of the seventy, an incident which he alone records; (b) Luke applies to the seventy the warning against danger which Matthew applies to the twelve.

(8) Mat. xi. 21-25; Lu. x. 12-15. "Woe unto thee, Chorazin," almost *verbatim*, except that where Matthew has *καταβήσῃ*, "thou shalt come down," Luke has (if the reading be correct) *καταβιβασθήσῃ*, "thou shalt be brought down."

(9) In Matthew no interval occurs between the last and the following passage; but in Luke intervenes (x. 17-20) the return of the seventy, and a mention of a vision in which Satan was seen falling from heaven, together with the imparting of a power to tread on serpents (compare the late appendix to Mark's Gospel, xvi. 18); then comes Mat. xi. 25-28; Lu. x. 21-22, "I thank thee, Father, Lord of heaven and earth," &c. There is but a trifling exception to the agreement. Note also that Luke apparently considers the two sayings which are continuous in Matthew to have been discontinuous, for between vers. 21 and 22 he inserts (so Lachmann, Tischendorf, and Tregelles) "and turning to His disciples, He said."

(10) Mat. xiii. 16, 17; Lu. x. 23, 24. "Blessed are the eyes," &c.; here, again Luke inserts his usual note of a discontinuous saying by inserting "and turning to His disciples, He said privately." Matthew *ἐπεθύμησαν*, Luke *ἠθέλησαν*; Matthew *δικαιοί*, Luke *βασίλεις*. Otherwise *verbatim*.

(11) Mat. vi. 10-13; Lu. xi. 2-4. The Lord's Prayer. Here, where (if anywhere) we should expect identity, there is considerable difference. Luke, after *Πάτερ*, omits (a) *ἡμῶν δ' ἐν τοῖς οὐρανοῖς*, and (b) *γενήθῃ τὸ θέλημά σου, ὡς ἐν οὐρανῷ καὶ ἐπὶ τῆς γῆς*. Further, Luke substitutes (c) *δίδου* for *δός*; (d) *τὸ καθ' ἡμέραν* for *σήμερον*; (e) *τὰς ἁμαρτίας* for *τὰ ὀφειλήματα*; (f) *ἀφίμεν* for *ἀφήκαμεν*; (g) *πάντῃ τῷ ὀφείλοντι* for *τοῖς ὀφειλέταις ἡμῶν*; and he also (h) omits the clause *ἀλλὰ ῥύσαι ἡμᾶς ἀπὸ τοῦ πονηροῦ*.

If any words of the Lord have been handed down by oral tradi-

<sup>1</sup> It is noteworthy that, whereas Matthew explains "poor" or "hungry" spiritually, "Blessed are the poor in spirit; . . . Blessed are they that hunger and thirst after righteousness," Luke, on the other hand, gives these sayings without Matthew's explanations, "Blessed are ye poor; blessed are ye that hunger now." It is possible that Luke lays greater stress than any of the other evangelists on the sin of covetousness (see the parables of Lazarus and Dives, the "rich fool," the narrative of the "would-be heir," &c.; and note also the evident gratification with which the author of this Gospel records in the Acts (iv. 32) the communism of the early church in Jerusalem); and this might predispose us to attribute Luke's rejection of the spiritual modification of these words to doctrinal grounds. But it must be borne in mind that the tendency in the history of the Gospels is everywhere to accretion and addition, rather than to rejection, so that shorter forms are generally more likely to be genuine than longer forms. Moreover, elsewhere Luke (xiv. 26) retains a stronger form of the words of Jesus, "If any man hate not his father and mother," while Matthew (x. 37) has a weaker one. On the whole, therefore, it is more probable that Luke, in omitting the words, "after righteousness," &c., represents the letter of the original words of Jesus more closely than Matthew (as perhaps also in the Lord's Prayer, see below), however much the latter may better represent the spirit of them.

tion, the Lord's Prayer would seem necessarily to have been thus handed down, and from the earliest times. Internal evidence also leaves little doubt that here oral tradition, and not a document, is the origin, and that Luke represents the original most closely in his omissions, though not in his changes. If the Lord's Prayer had been early committed to writing, and had contained Matthew's additional clauses, it is inconceivable that Luke should have omitted them. The same tendency which led a later generation to insert (and us in modern times to retain) the interpretation, "For thine is the kingdom, the power, and the glory," &c., would no doubt in the earliest times favour the insertion, rather than the rejection, of any appropriate clauses that had once gained a footing in the prayer. The abruptness of the simple *Πάτερ*, which is distasteful to us, as implying too great familiarity, would naturally commend to the early church Matthew's (a) insertion. Matthew's second insertion (b) is no less natural. It, or something much like it, is found in 1 Mac. iii. 60, "Whatsoever be His will in heaven, so let Him (or will He) do" (*ὡς δ' ἂν ᾖ θέλημα ἐν οὐρανῷ, οὕτως ποιήσει*); moreover, Luke himself assigns very similar words to our Lord Himself, xxii. 42 (*μὴ τὸ θέλημά μου ἀλλὰ τὸ σὸν γινέσθω*), and to the friends of St Paul (Acts xxi. 14). The fact that our Lord Himself used this prayer may have seemed sufficient cause in the earliest times, and especially to Matthew, who is in the habit of massing together doctrine of a certain kind, as in the Sermon on the Mount, for inserting it in the Lord's Prayer. (c) Luke's change of the aor. imperative into a present implies a desire to represent a continuous and not an isolated action; and (d) the change of *σήμερον* into *καθ' ἡμέραν* is explicable by the same motive. The word *ἐπιούσιος*, common both to Matthew and Luke, and not found elsewhere in the whole of Greek literature, seems to indicate that a Greek tradition, and not an Aramaic tradition, of this prayer, was the basis of both Matthew's and Luke's version. It is probably derived from *ἡ ἐπιούσα* (Prov. xxvii. 1, *οὐ γὰρ οἶδας τι τέξεται ἡ ἐπιούσα* (□<sup>1</sup>)), "Thou knowest not what the day will bring," and, probably (though this is disputed), means "for the immediate future, the instant."<sup>1</sup> This meaning is consistent both with Matthew's *σήμερον* and with Luke's *τὸ καθ' ἡμέραν*. Luke's next three changes, (d), (e), and (f), substitute the more intelligible word "sin" for the less intelligible "debt," and the more intelligible present "we forgive" for the less intelligible past "we forgave;" and increase the emphasis by adding "every one (that is our debtor)." In all these cases Matthew's seems to be the earlier form; for it is more likely that the comparatively difficult version of Matthew should have been altered into the comparatively easy version of Luke than *vice versa*. Besides, the retention of the metaphorical *ὀφείλοντι* by Luke, in the second clause, indicates that the metaphor of "debt," appeared in the original (g). Matthew's insertion of the clause "deliver us from the evil" may naturally have arisen from the reluctance to end a prayer with a negative petition, "lead us not into temptation." The inserted clause resembles many passages in the Psalms (xvii. 49, LXX.; A. V. xviii. 48, *ἀπὸ ἀνδρὸς ἀδίκου ῥύσῃ με*), and early commended itself to the church (2 Tim. iv. 18). In any case, there is no reason why Luke should omit such a clause, if it were known to him; and there are many reasons why such a clause should be introduced (even though it were not in the original), and why, when introduced, it should be speedily accepted. To sum up the inferences from this most important passage: the variations (and the nature of the passage) indicate a source oral and not documentary, Greek and not Aramaic; Matthew appears to have massed together a number of prayers taught by, or perhaps used by, the Lord Jesus, while Luke seems to have adhered to an earlier form, which, however, has received late modification for the purposes of daily use. Though, however, we may follow Luke here, as more closely approximating to the original form of the prayer, it does not result that on this account we must commit ourselves to the statement that the Lord's Prayer was actually given at the exact time, and in the exact manner, which Luke describes. Just as Matthew supplies grouping, so Luke supplies motives and occasions. Often it may be more probable that the grouping and continuity of Matthew may be closer to the historical fact than the attempt at orderly arrangement, and at assignment of motive and cause and time, which characterizes Luke. Instances of this will be given hereafter.

(12) Mat. vii. 7-12; Lu. xi. 34-36. "Ask, and it shall be given unto you," &c. Luke prefaces this by a parable peculiar to himself, and of a peculiar type,—the argument being that if an indolent man grants requests, influenced by mere importunity, much more will the perfectly good God listen to earnest prayer. There is no reason, in the style or thought of this and similar parables, for supposing that we have the exact words of Jesus. Luke inserts in the part common to him and Matthew a clause about an "egg and scorpion;" and where Matthew has "good

<sup>1</sup> There appears to be a reference to the manna which (Exod. xvi. 4) the people of Israel were to gather from day to day. So Philo, *Alleg.*, iii. 57, "Let the soul therefore collect the food of the day for the day (*τὸ τῆς ἡμέρας εἰς ἡμέραν*)."

things" Luke has "the Holy Spirit." With these exceptions, the agreement is nearly *verbatim*.

(13) Mat. vi. 22-23; Lu. xi. 9-13. "The light of the body is the eye." Similar in the first part; but varies (seemingly through confusion) towards the end.

(14) Mat. xii. 30, 43-45; Lu. xi. 23-26. "He that is not with Me is against Me, and he that gathereth not with Me scattereth," followed by "When the unclean spirit goeth forth from the man," &c., nearly *verbatim*, but apparently better placed by Matthew than by Luke, who has transposed the passage into the neighbourhood of the discourse on Beelzebub, moved possibly by the superficial resemblance of subject ("unclean spirit" and "Beelzebub"), not perhaps perceiving that it is the climax of a condemnation of "this evil generation," which last words (Mat. xii. 45) Luke omits.

(15) Mat. xii. 41, 42; Lu. xi. 31, 32. "The queen of the south shall rise up," &c. The queen of the south is placed by Luke before, by Matthew after, the "men of Nineveh;" and in one of the clauses (very curiously, but perhaps with a desire to bring out the antithesis between the "women" and the "men") Luke substitutes "the men of this generation" for "this generation," and "them" for "it." Otherwise the agreement is almost *verbatim*.

(16) Mat. xxiii. 23-39; Lu. xi. 37-52. A denunciation of those who tithed mint and anise, yet were the true children of the murderers of the prophets. Matthew makes this a part of a long and public denunciation of the Pharisees, in Jerusalem; Luke places it early, and as an utterance in the house of a Pharisee, his host. It is certainly remarkable that here, and nowhere else, a Pharisee is addressed in the singular number, "Thou blind Pharisee" (Mat. xxiii. 26). The "Pharisee" is clearly generic; but if the use of the singular were misunderstood, it might originate a tradition that the speech was delivered to a single Pharisee, in whose house Jesus was dining; and though Luke does not insert the "Pharisee," he may have been influenced by this traditional misunderstanding. Internal evidence is here strongly for Matthew's, and against Luke's place and time. Luke has probably been led to place this discourse at the table of a Pharisee, by the metaphor of the "cup and platter." But the metaphor suits Matthew's version equally well; and it is in defiance at once of good taste and probability, to attribute to Jesus such a denunciation of a host at his own table, and to place it so early in our Lord's ministry. The use (Lu. xi. 39) of *ὁ κύριος* (see below, 22) makes it probable that this is a late tradition; and, if it is rejected, there falls with it an accusation brought against Jesus, of neglecting the decencies of life, by coming to a repast with unwashed hands. The agreement is here by no means *verbatim*; and, besides other differences, Matthew has *τὸ ἐν τῷ καθάρειον*, where Luke has *τὰ ἐνόντα δόξαι ἐλεημοσύνην* (a change, as in the Lord's Prayer, from the metaphorical to the real). The original and Judaean expression *σοφοὺς καὶ γραμματεῖς* Luke alters into the Christian *ἀποστόλους*; he also omits the somewhat difficult *στὰν ῥώστε*. It is especially noteworthy that, whereas in Matthew Jesus says, "Wherefore, behold I send unto you prophets," &c., in Luke Jesus says, "Wherefore, also the Wisdom of God said, I will send unto them prophets," &c. Here Luke probably represents the earlier form, although the explanation may be doubtful. It is possible that the book containing the "words of the Lord," from which Matthew and Luke borrowed this saying, gave to Jesus the name of "the Wisdom of God" (cf. 1 Cor. i. 24, "Christ the Wisdom of God"), and that this title was retained by Luke, but applied, not to Jesus, but to the divine providence. Matthew adds to Zachariah the words "son of Barachiah;" Luke omits them. Here again Luke probably represents the earlier tradition. The Zachariah here mentioned was the son of Jehoiada. But Matthew, whose manner it is to lay especial stress upon all matters connected with the prophets (Schenkel's *Bibel-Lexicon*, "Sacharja"), having in his mind either Zechariah, the son of Jeberechiah (Is. viii. 2), or Zechariah the prophet, the son of Berechiah (Zech. i. 1), inserted the erroneous words. The agreement here is by no means *verbatim*. Matthew makes the utterance continuous, but Luke (xi. 45), introducing a remonstrance from a "lawyer," turns the denunciation from the Pharisees to the "lawyers."

(17) Mat. x. 28-31; Lu. xii. 4-8. "Fear not them which kill the body," &c. Instead of Matthew's "shall fall to the earth without your father," Luke has the more general phrase, "is forgotten in the presence of God." In other parts of the passage there is considerable dissimilarity.

(18) Mat. x. 32, 33; Lu. xii. 8, 9. "Whosoever shall confess me before men," &c. Not *verbatim*. Besides other differences, instead of Matthew's *ἐμπροσθεν τοῦ πατρὸς μου*, Luke has *ἐμπροσθεν ἢ ἐνώπιον τῶν ἀγγέλων τοῦ Θεοῦ* twice. This expression occurs in another passage peculiar to Luke (xv. 10), and nowhere else.

(19) Mat. vi. 25-34; Lu. xii. 22-34. "Wherefore I say unto you, Take no thought," &c. This is the second passage (see above, Mat. xxiii. 34; Lu. xi. 49) common to Matthew and Luke, introduced by "wherefore" though the context is different. Matthew

(vi. 25) introduces the passage by a single sentence, to the effect that no one can serve two masters, God and mammon. Luke, on the other hand, after narrating the refusal of Jesus to become a "judge or a divider," and after describing in language and thought peculiar to himself (for to Luke alone belong the parables of soliloquy) the death of the rich fool, continues thus: "And He said unto His disciples, Therefore I say unto you, Take no thought," &c. The comparison of this passage is most useful as illustrating the difference between Matthew's and Luke's handling of their subject matter, and also as throwing light on the object (and perhaps on the origin) of many of the parables peculiar to Luke. They seem intended as tales to prepare the way for some famous saying of the Lord as the conclusion and moral. The agreement in language here is not *verbatim*. Besides other differences, Luke changes the *πετεῖνὰ τοῦ οὐρανοῦ* into *κόρακας*, moved perhaps by the memory of the ravens, for whom God "provideth food" (Job xxxviii. 41; Ps. cxlvii. 9). But Luke's *καὶ μὴ μετρωπίζεσθε*, instead of *ἢ τὴν περιβαλλόμεθα*, suggests some difference of original text, or some different rendering of the same original rather than a mere alteration.

(20) Mat. vi. 19-21; Lu. xii. 33, 34. "Lay not up for yourselves treasure," &c. There is little exact similarity of language here, except in the last sentence.

(21) Mat. xxiv. 42-51; Lu. xii. 39-46. "But know this, that if the Goodman of the house had known," &c. In Matthew this sentence comes towards the end of a long discourse on the second coming, uttered in Jerusalem; in Luke it is spoken in Galilee, and it is preceded by a passage peculiar to Luke, and reminding one of the Epistles: "Let your loins be girded about, and your lights burning," &c. With the exception of Matthew *εἶπας*, Luke *ἀφῆκε* (probably the original word), the passages agree almost *verbatim*.

(22) Mat. xxiv. 45; Lu. xii. 42. "Who then is the faithful and just," &c. Here there is precise agreement, except where Luke has altered the text with an object. Finding this parable, in the book or tradition from which he extracted it, connected with the name of Peter, and desiring to distinguish the "steward" or upper "servant," who is placed over the household, from the common slaves, he (a) inserts a question of Peter, "Speakest Thou this parable unto us or even unto all?" (b) alters the first *δοῦλος* ("slave") into *οἰκονόμος* ("steward"); (c) alters *οἰκετείας* ("household," the true reading of Matthew) into a word with somewhat higher associations, *θεραπεύς* ("suite" or "retinue"); and (d) changes *συνδούλους* ("fellow-slaves") into "the man-servants and maid-servants." One or two other changes are also made (*μεθύσκεσθαι* and *τε*) to improve the text. Luke's *στοιμέτριον* and *ἀπίστων*, for Matthew's *τροφὴν* and *ὑποκριτῶν*, might be early variations arising from the varying translation of some Aramaic original. There remains the curious fact that, in introducing this parable, Luke uses the rare *κύριος* (used not as a vocative in speech of address, but in narration), instead of *ἰησοῦς*: "The Lord said unto Peter." This is an almost sure sign of a late addition to the Gospels, often of an interpolation. The word *κύριος* is not used once thus in the correct text of Matthew. It is not used once in the genuine Mark; but it is used twice in the short interpolated appendix to Mark (xvi. 19, 20). In Luke it is used about twelve times, always in prefaces or other passages peculiar to Luke, and of these twelve passages three are connected with Peter (xii. 42; xxii. 31; xxii. 61).

(23) Mat. x. 34-36; Lu. xii. 51-55. "Think ye that I came to send peace on earth?" The agreement is not *verbatim*, and suggests two independent translations from an Aramaic original. Instead of Matthew's *μάχαιραν*, "a sword," Luke has *διαμερισμόν*, "division." This might either be the divergence of translators (so *כּוּר* is translated in the LXX. both *μάχαιρα* and *πόλεμος*), or it might be a mannerism of Luke (cf. *ἐπισιτισμόν*, ix. 12; *ἱματισμὸς*, vii. 25; ix. 29, where Matthew has severally *βρώματα*, *μαλακά*, and *ἱμάτια*).

(24) Mat. v. 25, 26; Lu. xii. 58, 59. "Agree with thine adversary," &c. This passage is not *verbatim* in Matthew and Luke, except in the last sentence. The word *πάγειν* in Luke (which Luke as a rule systematically alters or omits whenever it is found in the common tradition of Matthew and Luke [see Mk. i. 44; ii. 11; x. 21; xiv. 21]) indicates that therein Luke is following some early tradition: but *κατασύρῃ*, *πράκτωρ*, and *λεπτόν* (Luke's "half-farthing," instead of Matthew's "farthing") seem all later touches added to give graphic variety and climax.

(25) Mat. xiii. 33; Lu. xiii. 21. "The kingdom of heaven is like unto leaven," &c. Nearly *verbatim*.

(26) Mat. viii. 11, 12; Lu. xiii. 28, 29. "Many shall come

<sup>1</sup> It is curious that, in the only passage where Luke agrees with Mark in reading *πάγειτε* (Mk. xi. 2; Lu. xix. 30), Matthew differs (xxv. 2), using the word *πορεύεσθαι*. There may be noted a general tendency of Luke to diverge from Mark, and of Matthew to diverge from Mark, wherever Mark agrees exactly with the narrative (as distinct from the words of the Lord) in Matthew and Luke respectively.

from the east and the west," &c. In Matthew these words are uttered by Jesus as a comment upon the marvellous faith of the centurion. In Luke they follow a parable peculiar to himself. The clause "there shall be weeping and gnashing of teeth" (which, except in this instance, is peculiar to Matthew) is transferred from the end to the beginning; and there are other variations, seemingly purposed. The agreement is far from *verbatim*.

(27) Mat. xxiii. 37-39; Lu. xiii. 34, 35. "Jerusalem, Jerusalem," &c. This is a conspicuous instance of the manner in which Luke has sometimes deviated from the true chronological order. He represents these words to have been uttered in Galilee, when the Pharisees warn Jesus to flee from fear of Herod. But Matthew represents them as having been uttered in Jerusalem, and in the temple. The reason for Luke's transposition is possibly contained in the last words, "Ye shall not see Me till the time come when ye shall say, Blessed is He that cometh in the name of the Lord." Now these very words, "Blessed is He," &c., were uttered by the crowd welcoming Jesus on His entrance into Jerusalem (xix. 39). Luke therefore, regarding the words of Jesus, "Ye shall not see Me," as a prediction necessarily preceding its fulfilment, is bound to place these words before the entry of Jesus into Jerusalem. But all internal evidence is on the side of Matthew's order, and against Luke's. The agreement is very nearly *verbatim*, but Luke (whose arrangement does not require the word) dispenses with the "henceforth" of Matthew.

(28) Mat. xxii. 1-14; Lu. xiv. 15-24. The parable of the wedding feast. These parables differ entirely in language, and somewhat in thought. In Matthew those who are first invited slay the messengers, and are slain by the king; and, among those who are subsequently invited, one is rejected for being without a wedding garment. In Luke the guests are simply discourteous, and the host merely invites others (the poor and the maimed, and then the wanderers in the streets) in the place of the first. Matthew's parable is therefore political, Luke's social. Note, however, that in the parable of the pounds (Mat. talents, xxv.), Luke introduces (xix. 27) the missing political element, whereas Matthew there omits it. Clearly no common document nor even detailed tradition originated these parables. They are rather (as also are the parables of the talents and the pounds) of the nature of sermons or stories based upon short "words of the Lord" as texts. It is obvious that Matthew lays special stress upon the exclusion of the unfit intruder, Luke upon the inclusion of all the world.

(29) Mat. x. 37-39; Lu. xiv. 26, 27. "He that loveth father and mother more than Me," &c. In Matthew these words are addressed by Jesus to the twelve in Galilee; in Luke to the multitude following Him during His journey to Jerusalem. Here Luke seems to have preserved the older (because more difficult) form of the tradition: "Whosoever *hateth not*" (Marcion altered *μισεί* into *καταλείπει*) "his father, . . . yea, his own life also," &c. It seems more probable that this was the original form than that Luke intensified the form by any alteration of his own. There is scarcely any agreement of language between Matthew and Luke here.

(30) Mat. xviii. 12-14; Lu. xv. 4-7. "What man having an hundred sheep," &c. The thought is the same, but there is scarcely any similarity of language; and even the conclusion characteristically differs, Matthew having "it is not the will of your Father in heaven that one of these little ones should perish;" Luke having "there is joy in heaven over one sinner that repenteth." The contrast between the negative ("not the will") and the positive ("joy"), between the "non-perishing" and the "repenting," is typical of the contrast between the whole of Matthew and the whole of Luke.

(31) Mat. vi. 24; Lu. xvi. 13. "No (servant) can serve two masters," &c. With the exception of "servant" added by Luke for definiteness, this saying is the same *verbatim* in Matthew and Luke.

(32) Mat. xi. 12 and v. 18; Lu. xvi. 16, 17. "The law and the prophets were till John," &c., and "Not one tittle shall pass from the law." There seems little connexion in these sayings as they stand in Luke, and there is very little similarity of language between Matthew and Luke.

(33) Mat. xxiv. 26-28, 37-41; Lu. xvii. 23-27, 34-37. These are scattered sayings on the second coming, likening it to the "days of Noah" and to "lightning," and predicting the severance of those who are "at one mill" and "in one bed." Luke, after his manner, introduces a question, "Where, Lord?" to which the reply comes, "Whosoever the body is, thither will the eagles be gathered together." Matthew, on the other hand, introduces the sentence in the midst of the discourse, "So shall also the coming of the Son of Man be, for whosoever the body is," &c. The agreement of language is not considerable, except in the last part.

(34) Mat. xxiii. 12; Lu. xviii. 14, and xiv. 11. "Every one that exalteth himself shall be abased," &c. This again furnishes a striking instance of the manner in which Luke utilizes words

of the Lord as texts for discourses. The saying is introduced by Matthew in the midst of the discourse against the Pharisees; but it is made by Luke the conclusion and moral of the parable of the publican and the Pharisee, and of the discourse on choosing the lower room.

(35) Mat. xxv. 14-30; Lu. xix. 1-28. The parable of the talents or pounds. There is no similarity of language, except in the dialogue between the idle servant and the master. Luke, after his manner, inserts a question from the bystanders ("And they said to him, Lord, he hath ten pounds"); and Luke here, as Matthew above (28), introduces a political element, making the master a king, and narrating a royal vengeance.

In the consideration of the passages quoted above, one fact strikes us at once, that the Lord's Prayer is not *verbatim* the same in Matthew and Luke. If *this* is not identical, it might be thought that we cannot expect any words of the Lord to be identical. And indeed, as a matter not of hypothesis but of fact, those words which have most strongly appealed to men's hearts, and have been most frequently on their lips, from the earliest times of the church; those sayings which have given the tone to Christian life, which have encouraged martyrs, and stimulated waverers, such as (17), "Fear not them which kill the body;" (18), "Whosoever shall confess," &c.; (29), "He that loveth father or mother more than Me," &c.—all these, though identical as regards thought, and similar as regards words, are nevertheless not exactly similar in Matthew and Luke. The exactly similar passages are of a very different nature: they are for the most part passages of a prophetic or historical rather than a doctrinal character with application to individuals. Some, (1), (2), (5), (6), describe the relations between John the Baptist and Christ; another, (8), calls down woe on Chorazin; another, (9), in language that reminds us of the thoughts, though not of the words, of the Fourth Gospel, thanks God for revealing to babes what He has hidden from the wise and prudent; another, (27), pours forth lamentations over doomed Jerusalem. All these passages, dealing as it were on a large scale with the will of God, as it affects religions and nations rather than as it affects individuals, are better fitted for reading in the services of the church than for being transmitted from mouth to mouth in the family from father to son, or from catechist to catechumen, for personal and individual guidance; and consequently they seem more likely to have been handed down in a book than by means of oral tradition. The same conclusion applies to (21), "But know this, that if the Goodman," &c. and to (22), "Who then is the faithful and just steward," &c.—both of which passages agree *verbatim*, and both of which appear to have an ecclesiastical rather than an individual reference, at all events in their primary application. In proportion as a rhetorical passage limits itself to individual application, it seems to have been modified by oral tradition so as to deviate from exact agreement: compare in (3) the "mote and the beam;" also (12), "Ask, and it shall be given unto you;" and (19), "Take no thought for the morrow." The only exception perhaps to this rule is in the denunciation of the Pharisees (16). This passage, being of the historical type, ought (according to our rule) to be identical; but Luke differs from Matthew considerably. Possibly, in the earliest days of the church, and especially in the synagogues of Palestine a few years after the death of Christ, the angry conflicts between the disciples of the Lord and the Pharisees may have frequently reproduced and modified by traditional influences the original form of our Lord's denunciation; so that perhaps this subject comes naturally under the head of traditional doctrine. It must also be remembered that, as Luke approaches the later period of the work of Christ in Judæa, he deviates more and more both from Matthew and from Mark; perhaps because there was a Judæan as well as a Galilean tradition of the life of Jesus, and Luke, in the latter part of his history, depended

mainly on the former. These two considerations may explain the deviation of Luke from Matthew in the denunciation of the Pharisees.

That the parables should diverge is natural. Their length and number would prevent them from being remembered, or passed from mouth to mouth, with the same fidelity with which the shorter words of the Lord would be preserved; and as they were probably often repeated by Jesus in varied shapes, no one particular shape of any parable would seem to claim a place in the written document of the words of the Lord, as being of the same importance as the "Woe to Jerusalem," or the other strains of poetic prophecy. The parable of the sower, coming first in order, and being typical of the rest of the parables, and having appended to it an explanation of the motive of the parabolic teaching, would naturally attract attention from the earliest times, and consequently it found a place in the Triple Tradition; but this privilege was accorded to no other parable. There is therefore no ground whatever for inferring from the discrepancy of the language of a parable in Matthew and Luke (*e.g.*, the parable of the lost sheep) that it was not actually uttered by Jesus. The exact similarity of thought and sequence of incident in that parable, as recorded by Matthew and Luke, proves to demonstration that the two records are derived from one source.

The following are our conclusions therefore about the additions to the Triple Tradition made jointly by Matthew and Luke. (1.) Their omission by Mark furnishes no argument for their rejection, inasmuch as Mark also omits the Lord's Prayer, and obviously aims at narrating the acts rather than the sayings of the Lord. (2.) Of the additions, some appear to be based upon common tradition, or on documents modified by tradition,—principally those short trenchant sayings (including the Lord's Prayer) which are of a universal and private application. (3.) Others appear to be based upon a common document; and in these documentary additions (as perhaps to some extent in the rest) Luke seems to have modified the original tradition, in words and phrases, with a view to purity of style and intelligibility, or to remove difficulties. (4.) In chronological order and arrangement Matthew and Luke pursue divergent paths; Matthew's object being to group and mass the teaching of the Lord, while Luke aims at supplying motive, occasion, place, and time for each utterance. It is scarcely possible to doubt that the arrangement of neither is to be implicitly adopted. There is much reason to doubt whether what is called the Sermon on the Mount was actually delivered at one time in the shape in which Matthew presents it; and it is equally questionable whether the lamentation over Jerusalem was delivered in a village of Galilee, and whether the denunciation of the Scribes and Pharisees (as murderers, on whom should be avenged all the innocent blood shed from the beginning of the world) was uttered at the table of a Pharisee. (6.) As regards the parables, we have to depend—in our conjecture as to the degree to which the thoughts of Jesus have been preserved—mainly upon the presence in them of the same spiritual power and insight which are perceptible in His other recognized genuine sayings. But the dissimilarity of the language of the parables in Matthew and Luke (where the thought is the same) gives no ground for denying that parables on the same subjects, and to the same effect, were actually delivered by Him. (7.) Since the hypothesis that Luke borrowed from Matthew is untenable, and since therefore we must suppose that Matthew and Luke borrowed these additions independently from some early document, we may infer that, before the times of Matthew and Luke, a document containing words of the Lord had existed long enough, and had acquired authority enough, to induce two editors or writers of Gospels, apparently representing different schools of thought

and writing for different churches, to borrow from it independently.

This last conclusion is of the greatest importance; for though the document may be, and almost certainly was, later than the Triple Tradition, yet it would have the advantage of preserving the original utterances of the Lord comparatively unimpaired by traditional transmutations. When to this consideration is added the authoritative nature of the words of the Lord in this document, their direct reference to events, and the extreme improbability that any disciple would have, or could have, invented them,—for which of the apostles or subordinate disciples could have invented the discourse on "the lilies of the field," or the lamentation over Jerusalem, or the speech which likens John to "a reed shaken by the wind," and pronounces him the greatest of the prophets, yet less than the least in the kingdom of God?—we are led to infer that in all probability we have in these additions of Matthew and Luke a very close approximation to some of the noblest and most impressive utterances of Jesus Himself. With the exception of the healing of the son of the centurion, and the narrative of the temptation, the additions common to Matthew and Luke introduce no new supernatural element.

*The Additions and Peculiarities of Mark.*—It might be expected that when we come to the additions peculiar to each of the three synoptists we should find some increase to the accounts of supernatural events. Now it seems to be a striking proof of the antiquity of the Second Gospel that we find in it no additions of this kind. Not that Mark does not lay stress on what appears to be supernatural; on the contrary, he records acts of instantaneous healing with greater minuteness of detail than any other evangelist (vii. 31–37; viii. 22–26; ix. 14–27); but we find in Mark no mention of our Lord's birth or childhood, and only the barest prediction of His resurrection. As an explanation of the deficiency of information on the resurrection, it has been frequently suggested that the latter part of the Gospel may have been lost; and, less frequently (Weiss, *Marcusevangelium*, p. 511), that the Gospel was deliberately closed with the prediction of the resurrection by the mouth of an angel, because "the manifestations of the risen Saviour belong (according to the earliest notions) no longer to the earthly sphere of the action of Jesus, and therefore do not fall within the province of the Gospel." Few Greek scholars, however, will be induced to believe that the author of the Second Gospel deliberately chose to end a book on the good news of Christ with the words ἐφοβούντο γάρ. From a literary point of view the γάρ, and from a moral point of view the ill-omened ἐφοβούντο, make it almost incredible that these words represent a deliberate termination assigned by an author to a composition of his own. Others have suggested that the last page of the MS. may have been accidentally destroyed. But this suggestion seems to overlook the consideration that the MS. was in all probability written not for a private library but for use in the church, and that it would immediately be multiplied by copies. Again, we know, from reference to Mat. xxviii. 8 and Lu. xxiv. 9, that the common tradition ceases with the return of the women from the Lord's tomb. But it is precisely at this point that the genuine Mark (xvi. 8) also terminates. Now, that a page should have been torn out containing just that part of Mark which followed after the close of the common tradition would be a most remarkable and unlikely coincidence. It seems far more probable that Mark ends his Gospel here because the common tradition ended here, and because he scrupled to add anything to the notes and traditions which he knew to rest upon a higher authority than his own. If this be the true explanation, it stamps with the seal of a higher authority such traditions

as have been preserved to us by so scrupulous an author. We proceed therefore to an investigation of the peculiarities of Mark, with a confidence in him increased rather than diminished by the fact that he has neither the introductions nor the appendices which are found in the rest of the Gospels.

The first thing that strikes us in Mark is his duality. Verbosity we might be tempted to call it at the first sight; but though there is a certain disproportion in the space assigned to detail, duality, and not verbosity, is the better word. It is this duality which gave rise (see above, p. 789) to the erroneous supposition that Mark had borrowed from Matthew and Luke. But it may be shown, by reference to passages where there can be no possibility that Mark borrowed from Matthew and Luke (Mk. ii. 19; iii. 5; iii. 27; iii. 22, 30; v. 3, 5; xii. 44), that this duality is a part of Mark's style. In many cases, *e.g.*, iii. 22, 30 (Βεελζεβοὺλ ἔχει and πνεῦμα ἀκάθαρτον ἔχει), it is almost forced on the reader that the evangelist had before him two versions of one saying, and that in his "anxiety to omit nothing" he inserted both. Whether there be any definite traces of translation in his Gospel will be considered hereafter. But, so far, we merely note that some of Mark's dualities of expression might be explained as double renderings of the same original. Only one parable is peculiar to Mark; it is one that illustrates (iv. 26-29) the spread of the kingdom of God by the quiet, unperceived, and gradual growth of corn. The subdued tone of this (one of the most interesting of all the parables) was perhaps the reason why it was not at first widely known, as it undoubtedly is the reason why modern readers pay it too little attention. Mark also amplifies the story of the Baptist's execution (vi. 20-28), and the graphic story of the exorcism of the "legion." For the rest, the other additions peculiar to Mark consist either of dual expressions and amplifications of detail, or of realistic details which would naturally be subordinated in later times, as likely to be stumbling-blocks. For amplifications which treat of the resistance and ultimate submission of unclean spirits see i. 26, 27; i. 44; iii. 7-12; ix. 14-27; for others which relate to the crowding of people round Jesus, the publicity of His work, and His desire for solitude, see i. 28; i. 35-37; i. 45; ii. 1-4; ii. 15; iii. 10-12; vi. 32-33, &c. The narrative also, from first to last, abounds with expressions as to the manner and look and minute action of Jesus during dialogues or miracles (*cf.* iii. 5; vii. 31-37; viii. 22-26). In many of these additions Aramaic words are given as the very utterances of Jesus, *e.g.*, v. 41, Ταλαδὰ κοῦμι; vii. 34, Ἐφθαθά; xiv. 36, Ἀββὰ; sometimes, also, names that are given by no other writer, *e.g.*, Bartimæus, Boanerges, and Dalmanutha.<sup>2</sup> Unquestionably, under ordinary circumstances, this elaboration of unimportant detail<sup>3</sup> (and especially the introduction of

names—for instances of which see the Apocryphal Gospels *passim*) is a mark of a late writer, and of a composer of fiction rather than history. But all the characteristics of Mark support the belief that in his case they are rather the excrescences and redundancies of one who trusted his memory rather than his judgment, and who preferred to report rather than to select and arrange.

One proof of the early composition of Mark is the rudeness and even vulgarity of his Greek. He uses a great number of words which are expressly forbidden by the grammarians. For example, of Mark's phrase ἐσχάτως ἔχει (Mk. v. 23), Phrynichus says (ed. Lobeck, p. 389), "only the *canaille* use it in this sense;" the same grammarian also warns his readers against κράββατος (Mk. ii. 4, 9, 11, 12). Other words noted by Phrynichus, and used by Mark (some of which are also used by Matthew) but avoided by Luke, are μονόφθαλμος (ix. 47); εὐσχήμων (for πλούσιος, xv. 43); κολλυβισται (xi. 15); κοράσιον (v. 41); ὀρκίζω (v. 7); ῥάπισμα (xiv. 65); ῥαφίδος (x. 25).<sup>4</sup> Such words as these might naturally find their place in the mongrel Greek of the slaves and freedmen who formed the first congregations of the church in Rome; and they are therefore tokens of a date of composition earlier than that of Matthew and Luke. For it is not conceivable that such terms (some of which would so have jarred upon the ear of an educated Greek as almost to correspond to our "slang") should be substituted in later times for a more tasteful vocabulary; whereas it is easily conceivable, and *a priori* probable, that better Greek should, in the prosperous days of the church, be substituted for worse.

It is a natural characteristic of an unpractised reporter that he lays undue stress on a few vivid expressions and striking words, and that he reproduces or exaggerates anacolutha which, though not objectionable in a speech, are inconvenient in a book, because they tend to obscure or subordinate the subject matter. Many such words are inserted by Mark, and avoided by Matthew or Luke, or by both, *e.g.*, σχιζομένους, i. 10; ἀγναφος, ii. 21; κωμοπόλεις, i. 38; ἀναλον, ix. 50. For irregular constructions see iv. 28 (πλήρης σίτος, the correct reading); xii. 40, οἱ κατίσθοντες (altered by Luke); v. 23, ἵνα ἐπιθῇς; note also the curious change of construction from ἵνα to the infinitive in iii. 15, as compared with iii. 14. The Latinisms of this Gospel are well known: see xv. 15, τὸ ἱκανὸν ποιῆσαι; vi. 35, ὦρα πολλή; vi. 27, σπεκουλάτωρ; xv. 39, κεντυρίων. The words πραιτώριον (xv. 16), κήσος (xii. 14), and φραγελλοῦν (xv. 15) Mark shares with Matthew. Other barbarisms are the use of *σαν* with the indicative, and the use of *στι* to ask a question (ii. 16; ix. 11; ix. 28), both of which idioms are common in the *Acta Pilati*, and perhaps indicate Latin influence.

A still more cogent proof of the early date of Mark is that this Gospel contains many expressions which would be likely to be stumbling-blocks in the way of weak believers, so that they are omitted in the later Gospels, and would not have been tolerated except in a Gospel of extreme antiquity. For example, the strong expression (vi. 5, 6), "He was not able to do there any mighty work;" the statement (i. 32, 34) that *all* the sick were brought to Jesus, but that He healed only *many*, whereas Matthew (viii. 16) says that He healed *all*, and Luke (iv. 40) that He healed *each one* (ἐν ἑκάστῳ);

(xxvi. 52) adds the reproof addressed by Jesus to Peter; Luke (xxii. 50, 51) adds that it was the "right" ear, and that Jesus healed the man; lastly, the Fourth Gospel, while omitting the healing, retains the "right" ear, and adds that the servant's name was Malchus. In such a case it is impossible to feel certain that the simpler narrative of Mark may not have been modified by later accretions.

<sup>4</sup> Such arguments as that "Hippocrates used ῥαφίς" cannot count for anything against the general feeling of dislike for the word expressed by the dictum of Phrynichus, "ἡ δὲ ῥαφίς τι ἐστὶν οὐκ ἔστι γνῶμη."

<sup>1</sup> This is a quotation from Papias preserved by Eusebius (Kirchhofer, p. 123): "For he (Mark) took great care about one matter, viz., to omit nothing of all that (μὴδὲν ὧν) he heard." If Papias spoke of our Mark, it would seem that this must refer rather to the words than to the incidents recorded in his very scanty Gospel. It seems to be an apology for the disproportion of the narrative. In writing the narrative just as he took it down in notes (from Peter's discourses) "Mark," says Papias, "committed no error," but simply acted as a faithful reporter. We do not, of course, commit ourselves to the truth of this statement; we merely point out that the hypothesis that Mark's Gospel is a collection of "notes," will explain some of the peculiarities of its style.

<sup>2</sup> Mark's custom of placing the Aramaic original side by side with the Greek translation is perhaps in part suggested by the Palestinian dialect of our Lord's time, in which (especially in certain phrases) Greek and Aramaic were blended together, as in the phrase "my Lord," מֵרִי לֵרִי, which stands for מֵרִי, κύριε. See Lightfoot, *Galat.*, p. 167, for this and other instances. But in Mark the reduplication for the most part is confined to passages expressive of strong emotion.

<sup>3</sup> Take, as an instance, the wounding of the high priest's servant by Peter. Here Mark (xiv. 47) merely records the wound; Matthew

the attempt of His mother and brethren to lay hands on Him on the ground that He was insane (iii. 20-21); the imputation of an ambitious petition to James and John, instead of (as Matthew) to their mother (x. 35); the mention of the marvel of Pilate at the speedy death of Jesus, which might have been perverted to support those who denied that Jesus had really died upon the cross (xv. 44); the statement that Jesus only gave power to His apostles to cast out devils (iii. 15, correct text), and not (as Mat. x. 1) to heal diseases; the enumeration of the different stages by which Jesus, at least on one occasion, effected a cure, and the description of the, at first, only partial cure (viii. 24); the statement that the fig-tree, instead of being withered up "immediately" (as Matthew, *παράχρημα*, xxi. 19), was not observed to be withered till after the interval of a day; the bare statement (xvi. 4) that the women found the stone rolled away from the sepulchre (which might have been used to support the statements of those who maintained that the friends or enemies of Jesus had stolen His body), whereas Matthew (xxviii. 2) distinctly meets such an objection by asserting that an angel descended from heaven in the sight of the keepers and rolled away the stone;—these, and probably other expressions, indicate a very early date of composition, and a disposition to record facts as they came, without emphasis or subordination. Mark neither masses similar sayings or deeds, as Matthew does, nor supplies motives and occasions, as Luke does. It is most interesting to note that the words "law," "lawyer," which played so prominent a part in Matthew and Luke, are not to be found at all in Mark's narrative. His business is simply with the life of Christ. Again, whereas Matthew and (in a less degree) Luke are careful to point out that Jesus fulfilled the sayings of the prophets, Mark, on the other hand, though he recognizes in John the Baptist (i. 2) the messenger predicted by the prophets, sees in Jesus a Being too absorbing and interesting as a man to find much time for contemplation of Him as the mere fulfiller of prophecy. In a word, Mark writes of Jesus, not as the destroyer or fulfiller of the law, not as the Messiah predicted by the prophets, not as the refuge of the Gentiles, but rather as a man; subject to anger, and disappointment, and weariness; not knowing all things; not able to do all things; but endowed with strange powers of healing the souls and bodies of men; and carrying out a mysterious plan for the regeneration of the world, through a spirit of childlike obedience to God and brotherly love towards men; lastly, a man who assumed for Himself and for His disciples a power of forgiving sins, and who based all the success of His plans upon His predicted death and resurrection, to be followed by a second coming.

True, Mark's Gospel is disproportioned, inartistic, and uncouth—scarcely, indeed, to be called a book, but rather a collection of graphic anecdotes. Yet it has a unity derived from its naive simplicity and single-mindedness, in recording whatever it records as it was delivered from the earliest sources in its entirety; and possibly in that string of anecdotes the development of Christ's life and work may be traced with not less clearness than in the ampler and more artistic production of Luke.

*The Additions and Peculiarities of Matthew.*—The principal additions to the common tradition contributed by Matthew alone are the following:—

(1) i. 1-17, the genealogy of Jesus from David; (2) i. 18-25, the annunciation, and the dream of Joseph; (3) ii. 1-12, the adoration of the Magi; (4) ii. 13-23, the massacre of children in Bethlehem and the flight of the parents of Jesus to Egypt, together with their return to Nazareth; (5) iii. 13-17, the reluctance of John to baptize Jesus; (6) iv. 14-16, the fulfilment of the prophecy, "The people that sit in darkness," &c.; (7) v. 5-10, the six beatitudes on the sorrowing, the meek, the merciful, the pure in heart, the peace-makers, the persecuted; (8) v. 17-48, the new law is more exacting than the old law; (9) vi. 1-18, warnings against ostentation in almsgiving, prayer, and fasting; (10) vi. 34, "Sufficient for the

day is the evil thereof"; (11) vii. 6, "Give not that which is holy to dogs," &c.; (12) vii. 13, 14, "Broad is the gate," &c.; (13) vii. 22, "In thy name have we cast out devils," &c.; (14) ix. 13 and xii. 7, the saying, "I will have mercy and not sacrifice"; (15) ix. 27-34, the cure of two blind men and of a deaf man;<sup>1</sup> (16) x. 5-3, "Go not into any city of the Samaritans," &c., instructions to the twelve; (17) x. 23, "But when they pursue you in this city, flee unto the other; for verily I say unto you, Ye shall not have gone over the cities of Israel until the Son of Man be come"; (18) x. 25, "The servant is not above his master," &c.; (19) xi. 28-30, "Come unto Me, all ye that are weary," &c.; (20) xii. 17-21, the prophecy of Isaiah, "Behold my servant," &c., is fulfilled in Jesus; (21) xii. 22, 23, the healing of one that was both dumb and blind; (22) xii. 33, "Either make the tree sound and the fruit sound, or," &c.; (23) xii. 36, 37, "Every idle word," &c.; (24) xii. 40, "As Jonas was in the whale's belly," &c.; (25) xiii. 14, 15, the fulfilment of a prophecy of Isaiah in the misunderstanding of Christ's teaching; (26) xiii. 24-30, the enemy and the tares; (27) xiii. 35, the fulfilment of prophecy in Christ's teaching by parables; (28) xiii. 36-43, the interpretation of the parable of the tares; (29) xiii. 44-50, "The kingdom of heaven is like (a) a treasure, (b) a merchant buying a pearl, (c) a net; (30) xiii. 51, 52, Every disciple to bring forth things new and old," &c.; (31) xiv. 28-33, the attempt of Peter to walk upon the waves; (32) xv. 13, "Every plant that My heavenly Father hath not planted shall be rooted up," &c.; (33) xvi. 17-19, the blessing on Peter; (34) xvii. 24-27, the tribute money; (35) xviii. 3, 4, "If ye be not converted and become as little children, ye shall not enter," &c.; (36) xviii. 10, "Their angels do always behold," &c.; (37) xviii. 12-14, the parable of the hundred sheep (given by Luke in similar language); (38) xviii. 15-18, "Tell it to the church," &c., the course of procedure in case of quarrel; (39) xviii. 21, 22, the question of Peter, "How often shall my brother sin against me?" (40) xviii. 23-34, the parable of the unforgiving servant; (41) xix. 10-12, "There are some eunuchs," &c.; (42) xx. 1-15, the labourers in the vineyard; (43) xxi. 5, the fulfilment of the prophecy, "Behold thy King cometh," &c.; (44) xxi. 16, the fulfilment of the prophecy, "Out of the mouth of babes and sucklings," &c.; (45) xxi. 28-32, "I go" and "I go not"; (46) xxi. 43, "The kingdom of God shall be taken from you, and shall be given to a nation that bringeth forth the fruits thereof"; (47) xxii. 1-14, the parable of the despitel and murderous guests (very dissimilar in Luke); (48) xxiii. 1-3, "The Scribes and Pharisees sit in Moses' seat," &c.; (49) xxiii. 7-12; *ib.* 15-22, "Be not called Rabbi," &c., "He that sweareth by the altar," &c.; (50) xxv. 1-13, the parable of the ten virgins; (51) xxv. 14-28, the parable of the talents; (52) xxv. 31-46, the parable of the sheep and the goats; (53) xxvi. 51-64, "Put up thy sword," and "Thinkest thou not that I cannot now pray to My Father," &c.; (54) xxvii. 3-10, the fulfilment of the prophecy, "And they took the thirty pieces of silver," &c.; (55) xxvii. 19, "Have thou nothing to do with that just man," &c.; (56) xxvii. 24-25, Pilate washing his hands; (57) xxvii. 52, 53, "And many bodies of them that slept arose," &c.; (58) xxvii. 62-66, the Jews seal the sepulchre; (59) xxviii. 2-5, the angel rolls the stone from the tomb of Jesus; (60) xxviii. 9-15, the women clasp the feet of the risen Jesus; the soldiers are bribed to say that the disciples stole away the body; (61) xxviii. 16-20, Jesus appears to the eleven disciples on a mountain in Galilee.

The preface (chaps. i. and ii.) reveals a part of the purpose of the whole Gospel, in tracing the genealogy of Jesus, not from David merely, who was under the law, but from Abraham, who was the receiver of the promise (Gal. iii. 16) and the father of the faithful (Gal. iii. 7). Such a genealogy is the fitting preface of a book which aims at exhibiting the law, not as trampled upon but as fulfilled and developed into a higher law of promise, in which all the families of the world were to be blessed (Gen. xii. 3). But by this time also the church required some distinct affirmation concerning the divine origin of Jesus. The gap left in the opening of Mark's Gospel needed to be filled up. The mere earthly pedigree from Abraham was insufficient; nor did it suffice that Jesus should be declared to be spiritually the Son of God. It was necessary that the verity of the spiritual birth of Jesus from the Father should be embodied in a narrative so expressed as to be intelligible to all.

The differences between the prefaces of Matthew and Luke are obvious, and need no stress laid on them, except as illustrations of the freedom which, at this period, was allowed in the handling of the various introductions to the

<sup>1</sup> Possibly these narratives may refer to events also described by Mark; but, as the language presents no similarity, they are placed here

Gospel tradition. It is obvious, for example, that Luke regards Nazareth as the residence of Joseph and Mary from the first (i. 26; ii. 4), whereas Matthew seems to represent them as selecting Nazareth for their new home after the birth of Jesus and the return from Egypt, only because they were afraid to return to their old home in Judæa, thereby fulfilling an ancient prophecy (ii. 23). Throughout his preface, as throughout his version of the Triple Tradition, Matthew always bears in mind that Jesus came to fulfil the prophets as well as the law. The birth from a virgin (i. 25), the birth in Bethlehem (ii. 6), the return from Egypt (ii. 15), the massacre of the children in Bethlehem (ii. 18), and the residence in Nazareth (ii. 23) are all spoken of as the consequences of prophecies. It is scarcely fanciful, also, to see some reference to the infancy of Moses, and the slaughter of the Israelitish children by Pharaoh in the massacre of the children of Bethlehem by Herod.

Passing next to Matthew's version of the Triple Tradition, we note first the prominence given to the law. Instead of giving a chronological account of our Lord's acts and sayings, Matthew prefers to collect a mass of doctrine into one continuous discourse, known from early times as the Sermon on the Mount. This discourse follows almost immediately (iv. 11; v. 1.) on the commencement of His public life; and it contains the new law of the new kingdom. The Sermon on the Mount corresponds to the law given on Mount Sinai, and a thread of contrast runs through the former, comparing in each case that which had been said "of old time" with that which the New Lawgiver prescribed, and showing that in each case the new law, though more gentle, was also more stringent and more exacting than the old. "Depart from Me, ye workers of iniquity" (Lu. xiii. 27) is expressed by Matthew (vii. 23), "Depart from Me, ye that work lawlessness;" and this word "lawlessness" is found four times in Matthew, and not at all in the rest of the Gospels. Luke recognizes that no jot or tittle is to pass from the law till all be fulfilled; but nowhere in Luke shall we find the strong language which declares (Mat. v. 19) that he who breaks, or teaches others to break, one of the least of the commandments of the law shall be called least in the kingdom of God.

The genealogy traced from Abraham, and the stress laid on prophecy, as well as the prominence thus given to the law, all suggest that this book was primarily intended for Jewish readers; and this supposition is confirmed by the whole tenor of the Gospel. Matthew finds less space than Luke for the parables which point to the inclusion of the Gentiles, and more for those which point to the exclusion of the workers of lawlessness and of the unworthy Jews. He alone among the evangelists has the saying, "Many are called but few chosen;" and the distinction between the "called" (*κλητοί*) and "chosen" (*ἐκλεκτοί*) is the more remarkable, because Paul uses the two words almost indifferently, and Luke (though he too has the parable of the unworthy guests) has not ventured to use *κλητοί* in Matthew's disparaging signification. But Matthew, more than the rest of the evangelists, seems to move in evil days, and amid a race of backsliders, among dogs and swine who are unworthy of the pearls of truth, among the tares sown by the enemy, among fishermen who have to cast back again many of the fish caught in the net of the gospel; the broad way is ever in his mind, and the multitude of those that go thereby, and the guest without the wedding garment, and the foolish virgins, and the goats as well as the sheep, and those who even "cast out devils" in the name of the Lord, and yet are rejected by Him because they "work lawlessness." Where Luke speaks exultantly of "joy in heaven" over one repentant sinner, Matthew in more negative and sober phrases declares that it is not the will of the Father that one

of the little ones should perish; and as a reason for not being distracted about the future it is alleged that "sufficient for the day is the evil thereof": see above, (10), (11), (12), (13), (28), (29 c), (50), (52). It is far-fetched to suppose that these subjects are selected or amplified in antagonism to the doctrine of Paul. The condition of the Jews, their increasing hostility to the Christians, and the wavering or retrogression of many Jewish converts when the hostility became intensified shortly before and during the siege of Jerusalem,—this may well explain one side of Matthew's Gospel; and the other side (the condemnation of "lawlessness") might find an explanation in a reference to Hellenizing Jews, who (like some of the Corinthians) considered that the new law set them free from all restraint, and who, in casting aside every vestige of nationality, wished to cast aside morality as well. Viewed in the light of the approaching fall of Jerusalem, and the wavering or retrogression of great masses of the nation, the introduction into the Lord's Prayer of the words, "Deliver us from the evil," and the prediction (xxiv. 12) that "by reason of the multiplying of lawlessness the love of many shall wax cold," will seem not only appropriate, but typical of the character of the whole of the First Gospel.

Besides the fulfilments of prophecy mentioned in the preface, Matthew sees several others (6), (25), (43), (44), (54) which are not mentioned in the Triple Tradition, and these applications of prophecy sometimes contain obvious confusions. For example, Matthew sees in our Lord's entry into Jerusalem a fulfilment of the prophecy: "Thy king cometh . . . sitting upon an ass, and a colt the foal of an ass." The repetition seems to denote one animal, after the manner of Hebrew poetry, and only one is mentioned by Mark and Luke; but Matthew, applying prophecy more closely, speaks of two, and adds (xxi. 7) "they brought the ass and the foal and cast their clothes upon *them*, and he sat upon *them*." Again, in speaking of the "potter's field" (xxvii. 9), he quotes, as from Jeremiah, a prophecy that is really from Zechariah xi. 12 (the word translated "potter" is rendered by Ewald "treasury"; and [though Aquila has *πλάστην*] the LXX. has *χωρευτήριον*, "foundry," neither of which renderings will suit Matthew's application). Again, though Luke speaks of the "sign of Jonah," Matthew alone makes Jesus publicly declare that, as Jonah was three days and three nights in the belly of the whale (xii. 40), so He shall be three days and three nights in the heart of the earth; and such a declaration, exciting no questioning in the disciples, nor wonder in bystanders, appears in the highest degree improbable, and looks like a later application. It will be remembered that Matthew alone has the inaccurate statement that the murdered Zachariah was the son of Barachiah (xxiii. 35); and perhaps an inaccuracy resulting from a lapse of memory may explain, not only the use of the name of Jeremiah above, but also the quotation "He shall be called a Nazarene" (ii. 23), which is found in no existing book of prophecy. Similarly (perhaps) Mark, through lapse of memory on the part of those whose tradition he records, quotes (i. 2), as from Isaiah, according to the correct reading (the A. V. reads "prophets"), a prophecy composed of two passages, the first of which is from Malachi, and only the second from Isaiah. It must be remembered that, without the modern means for rapid reference, verification was a much harder task than now, and much more trust was necessarily given to memory.

Few new miracles are introduced by Matthew into the body of his work (15), (21), (31), (34). Two of these consist of acts of healing; and two are connected with Peter, viz., Peter's partial success in walking upon the waves, and his (supposed) extraction of a stater from the mouth of a fish. But the words implying the latter miracle have possibly arisen from a misunderstanding; at all events

they leave in the mind "a doubt whether, in this instance, some essential particular may not have been either omitted or left unexplained" (Farrar's *Life of Christ*, vol. ii. p. 46).

In its moral teaching this Gospel lays special stress upon the sin of religious ostentation and hypocrisy. In a strong passage (xii. 33) consistent undissembling wickedness is preferred to dissembled wickedness, and the Pharisees are described at greater length than in any of the other Gospels. Yet this Gospel does not always dwell upon the dark side of Christ's doctrine. It preserves also some of the Lord's most "comfortable" sayings: the blessings upon the meek and merciful; the saying that the angels of the little ones always behold the face of the Father; and above all that saying which is a gospel in itself, "Come unto Me, all ye that labour, and are heavy laden," &c. (xi. 28-30).

In speaking of the date of Matthew's Gospel, so far as it can be determined from internal evidence, we must remember that, if the work be composite, the fact that some of Matthew's additions are clearly late will not show that others may not be early. The saying, for example, that the disciples shall not have gone over the cities of Israel till the Son of Man shall have come (x. 23), seems to be an early and unaltered reminiscence of a saying of Jesus, which was not generally adopted in the tradition because of its recognized difficulty at a later date. It is possible that Matthew may consider the coming of the Son of Man fulfilled primarily in the transfiguration; for whereas in their prefaces to the transfiguration Mark and Luke write, "There are some standing here who shall not taste of death till they see the kingdom of God" (Mark adds "coming in power"), Matthew substitutes for "kingdom of God," &c., "the Son of Man coming in His kingdom." But, whatever may have been Matthew's theory, the difficulty of the utterance in Matt. x. 23 implies its early date. On the other hand, a decidedly late date seems implied in the expression "up to this day," which is twice found—once in the addition xxvii. 8 (the potter's field) and again in xxviii. 15 (the bribing of the guard by the chief priests). Yet these additions appear to be in the style of the writer both of the preface and the appendix, and of the other passages peculiar to Matthew.<sup>1</sup> It would follow that all these passages are of a late date, not added to the tradition till long after the death of Christ. The interval must have been long enough to allow, for example, the "potter's field"—and this argument holds whether the story of the potter's field (xxvii. 8) be historical or not—first, to acquire the name of the Field of Blood, and

secondly, to retain that name for so long a period (nearly at least a generation) as to make it possible for a writer to speak of the acquisition of the name as a far distant fact, writing that the name is still borne, even "to this day." The same expression in xxviii. 15,—where it is said that the false charge against the disciples, of stealing the body of Jesus, is commonly reported "unto this day" by "the Jews,"—warrants the same inference; and this inference is corroborated by the remarkable use of "the Jews." The author of the Fourth Gospel, writing at a much later date, habitually speaks of "the Jews" as an alien race, quite separated from the Christians; but this is not in the manner of the synoptistic tradition.

The uncertainty in which Mark left the resurrection of Jesus would naturally seem to later writers to require to be removed; and accordingly we find that Matthew adds to the vision of angels (two instead of one) a manifestation of Jesus Himself. But the whole of this narrative (xxviii. 9-20), though apparently in Matthew's style (*cf.*, for example, the remarkable use of *οἱ δέ*, without the *οἱ μὲν*, in the sense of "others," in xxviii. 17 with that in xxvi. 67), and though containing internal evidence of being composed long after the events narrated (xxviii. 15), is nevertheless strangely disjointed. Yet its very defects, its disconnectedness, incompleteness, and abruptness, indicate a date earlier than that of the more connected and completer narratives of the Third and Fourth Gospels. Matthew separates from Mark's narrative at the departure of the women from the tomb, having previously given an account (repeated by no other evangelist) of the resurrection from the dead of a great number of "saints," who "went into the holy city and appeared unto many." To Mark's simple statement that the women "found the stone rolled away" Matthew adds a graphic account of a glorious angel visibly descending from heaven, filling the keepers with fear, and rolling the stone away. Then, immediately after the women have departed with the angelic message, to bid the disciples to go to Galilee, Jesus suddenly appears to them. They clasp His feet, while He repeats over again the message that the disciples must go to Galilee there to behold Him. Without any further mention of the place of meeting, the disciples are said to have gone to "the mountain, where Jesus made agreement (*ἐράξατο*) with them (to meet them)." To avoid this dislocation, there has been suggested the desperate remedy (Weiss, *Matthäusevangelium*, p. 582) of rendering *ἐράξατο*, "laid down the law," with reference to the Sermon on the Mount; but the probable solution is that Matthew here extracts and separates from its context some ancient tradition which is obscured through want of its framework.<sup>2</sup> Again Matthew tells us that, upon this mountain, only the eleven were present, and that while some of them worshipped, others "doubted." This statement is of value as evidence that it was acknowledged, even so late as the compilation of Matthew's Gospel, that some at least of the manifestations of Jesus were of such a nature that, while they brought immediate conviction to some beholders, they did not at once convince others, even of His nearest disciples; in other words, the manifestation of Jesus depended upon other considerations than the mere physical sense of sight. But, on the other hand, the statement seems quite inconsistent with the supposition that in previous manifestations in or near Jerusalem Jesus had been recognized and worshipped by all the eleven. The last words of the Gospel represent Jesus as commissioning His disciples to go into all nations, preaching His gospel, and baptizing in the name of the Father, the Son, and the Holy Ghost. The thought con-

<sup>1</sup> Want of space renders it impossible to state the grounds on which it seems probable that Matthew consists only of (1) the Triple Tradition; (2) extracts from a book or tradition of the words of the Lord from which Luke also borrowed; and (3) an introduction, framework, and appendix, all added by one hand; though possibly the introduction and appendix, being borrowed, the former from an Aramaic source, the latter from a Latin source, may show differences of idiom not wholly concealed by the overlying style of the author who works up the materials. A similar use of the particles *δέ* and *καί*, and of participles, runs throughout almost all the non-traditional narrative parts of Matthew; and the rhythm of the sentences is very similar. But the linguistic evidence has not as yet been so selected, classified, and concentrated as to obtain any certain results. And until this is done, inferences drawn from isolated phenomena are likely to be very misleading. For example, it has been inferred (Weiss, *Matthäusevangelium*, p. 502) that the use of the form *Ἱερουσαλήμ* once only in Matthew (xxiii. 37, in a passage almost identical with Lu. xiii. 34, whereas Matthew uses *Ἱεροσόλυμα* eleven times) proves that Matthew borrowed the passage in which it occurs from an Aramaic source. Now it is true that other reasons make the hypothesis of an Aramaic source for the identical passages in Matthew and Luke extremely probable; but this use of *Ἱερουσαλήμ* is quite insufficient proof. For a comparison of Paul's use of *Ἱεροσόλυμα* (Gal. i. 17, 18; ii. 1) and *Ἱερουσαλήμ* (Gal. iv. 25, 26) will show that the same author might use the one form geographically and the other in a higher style, theologically or rhetorically. And this may possibly be held to explain the use of *Ἱερουσαλήμ* by Matthew in the highly rhetorical passage in which alone it is found.

<sup>2</sup> In a somewhat similar manner the author of the Second Epistle of Peter speaks of "the holy mount" (2 Pet. i. 18), assuming that his readers would understand the definite reference to the mountain of the transfiguration.

tained in these words furnishes a suitable termination to the Gospel, but there is every probability that we have not here the exact words of Jesus Himself. Not to speak of the introduction of the later baptismal formulary, "in the name of the Father, the Son, and the Holy Ghost," the rest of the vocabulary is not found in the words of Jesus as recorded in the Triple Tradition, but is peculiar to Matthew. For example, (1) the word *μαθητεύειν* (xxviii 19) is used three times by Matthew, and nowhere else in the New Testament, except once in the Acts, (2) the expression *συντελείας τοῦ αἰῶνος* (xxviii 20) is found five times in Matthew, and nowhere else in the New Testament, except once in the Epistle to the Hebrews, and (3) the word *τηρεῖν* (xxviii 20), used by Matthew six times, is used once only by Mark, and not at all by Luke.

It is noteworthy that Matthew makes no express mention of the ascension of Jesus. But it is possible that he considers this final manifestation on the mountain top to have terminated with the ascension, for Matthew, describing the farewell of Jesus, appears to have in his mind the picture, contemplated also by Daniel, of the Son of Man endowed with all power and seated on the clouds of heaven. Compare Daniel vii 14, "ἐδόθη αὐτῷ ἐξουσία," with Matthew xxviii 18, "ἐδόθη μοι πάντα ἐξουσία." And this perhaps may explain the twice repeated saying of Matthew, that some of the disciples should see the Son of Man coming. The manifestation of Jesus upon the mountain in Galilee, commissioning His disciples to go forth to make disciples of all the world, and claiming all kingdoms for Himself, might well seem a fulfilment of these two prophecies (x 23, xvi 28), as well as a fitting close to the book of the Gospel.

**Additions and Peculiarities of Luke**—The principal passages peculiar to Luke are—

(1) i 1-4, the dedication to Theophilus, (2) i 5-25, the vision of Zacharias, (3) i 26-38, the annunciation, (4) i 39-45, the meeting of Elisabeth and Mary, (5) i 46-56, the song of Mary, (6) i 57-80, the naming of John and the song of Zacharias, (7) ii 1-7, the journey of Mary to Bethlehem, (8) ii 8-20, the vision of the shepherds, (9) ii 21-35, the song of Simeon, (10) ii 36-40, the prophetess Anna, (11) iii 1-6, the child Jesus found in the temple, (12) iii 7-17, the precise date of the commencement of the public life of Jesus, (13) iii 18-22, the teaching of John the Baptist, (14) iii 23-38, Herod imprisons John, (15) iv 1-13, the genealogy of Jesus from Adam, (16) iv 14-20, the devil departs from Jesus "for a season", (17) iv 21-30, Jesus preaches at Nazareth, (18) v 1-11, the miraculous draught of fish and the call of Simon, (19) v 12-16, preface to the healing of the paralytic, (20) v 17-26, "No one having drunk old wine desireth new," &c, (21) vi 1-13, preface to the choice of the apostles, (22) vi 14-16, "Woe unto you that are rich," &c, (23) vi 17-26, "Love your enemies," &c (in language peculiar to Luke), (24) vii 1-10, the healing of the centurion's servant (in language peculiar to Luke), (25) vii 11-17, the raising of the widow's son at Nain, (26) vii 18-22, the acts of healing wrought before John's disciples, (27) vii 23-35, the sinful woman and the parable of the two debtors, (28) vii 36-50, the names of the women who accompanied Jesus, (29) ix 1-10, James and John wish to call down fire on the Samaritans, (30) ix 11-17, "No one having put his hand to the plough," &c, (31) x 1-11, the appointment of the seventy, (32) x 12-14, "I beheld Satan as lightning," &c, (33) x 15-17, the good Samaritan, (34) x 18-25, Martha and Mary, (35) xi 1-13, "Teach us to pray," &c, (36) xi 14-16, the friend persuaded by importunity, (37) xi 17-27, the rich fool, (38) xi 28-32, "When the strong man armed," &c, (39) xi 33-36, "Blessed is the womb that bare Thee," &c, (40) xii 1-5, "Fear not, little flock," &c, (41) xii 6-12, "Let your loins be girded about," &c, (42) xii 13-21, "But that servant that knew not his lord's will," &c, (43) xii 22-26, "I came to send fire on earth," &c, (44) xii 27-34, "When ye see a cloud rising," &c, (45) xii 35-48, the Galileans slain by Pilate, and the parable of the fig tree, (46) xii 49-53, the healing of the woman bound by Satan, (47) xii 54-57, "Are there few that be saved?" and the answer, (48) xii 58-64, "Go tell that fox," &c, (49) xiv 1-6, the healing of the dropsical man on the sabbath, (50) xiv 7-11, "Sit not down in the highest room," &c, (51) xiv 12-14, "When thou makest a dinner," &c, (52) xiv 15-24, the courteous guests, (53) xiv 25-33, "Which of you intending to build a tower," &c, (54) xv 1-10, the lost sheep (different in

Matthew), and the lost piece of silver, (55) xv 11-32, the prodigal son, (56) xvi 1-12, the unjust steward, (57) xvi 13-31, Dives and Lazarus, with preface, (58) xvi 32-34, the master must be served before the servant, (59) xvi 35-44, the grateful Samaritan, (60) xvi 45-52, "The kingdom of God cometh not with observation," &c, (61) xvii 1-8, "It shall be as in the days of Lot," &c, (62) xvii 9-14, the unjust judge, (63) xvii 15-18, the Pharisee and the publican, (64) xix 1-10, Zacchæus, (65) xix 11-27, the parable of the pounds (different in Matthew), (66) xix 28-44, "If thou hadst known even thou," &c, (67) xx 1-18, "Whosoever shall fall upon that stone shall be broken," &c, (68) xx 19-26, "There shall not an hair of your head perish," &c, (69) xx 27-34, "There shall be great distress in the land," &c, (70) xx 35-41, "And when these things begin to come to pass, then look up," &c, (71) xxi 1-11, "But take heed to yourselves lest at any time your hearts be overcharged with sleeping," &c, (72) xxi 12-16, with parts of 17 and 19, "With desire have I desired to eat this passover with you," &c, (73) xxi 31-34, "Simon, Simon, behold Satan hath desired to have you," &c, (74) xxi 35-38, "When I sent you without purse," &c, (75) xxi 43-44, the angel strengthening Jesus, (76) xxi 45-49, "Betrayest thou the Son of Man with a kiss?" (77) xxi 50-53, the healing of the wound of the high priest's servant, (78) xxi 54-58, Jesus is sent by Pilate to Herod, (79) xxi 59-65, Pilate proposes to release Jesus, (80) xxi 66-71, "Daughters of Jerusalem, weep not for Me," &c, (81) xxi 72-76, the penitent thief, (82) xxi 77-80, the crowd beat them backwards and return, (83) xxi 81-85, Peter sees the linen clothes in the open tomb, (84) xxi 86-88, the walk to Emmaus, (85) xxi 89-93, Jesus appears and eats in the presence of His disciples, (86) xxi 94-98, Jesus parts from the disciples near Bethany, and they return to the temple.

Before speaking in detail of the passages peculiar to Luke, it will be convenient to consider his avowed purpose in writing, and some peculiarities of his style. The dedication to Theophilus, a name which is now believed by many to be merely typical of every reader who is so far "loved of God" as to be admitted into the church of Christ, states that the author purposes to write an account "in order," and implies that many previous "attempts" (*ἐπεχείρησαν*, a word implying impotence, cf Acts ix. 29; xix. 13) at similar compilations had not been "in order," further it informs us that the object of the treatise was not to tell the reader anything that was new, but rather to give him an ampler knowledge of the certainty of those things which were then and always had been fully believed in the church, even as they had been handed down by those who had been from the beginning eye witnesses and ministers of the word. Without going so far as to affirm that the word handed down (*παρέδοσαν*) excludes written tradition (Westcott's *Introduction*, 186, 203), it is at least remarkable that Luke distinguishes between the "eyewitnesses" and those whose attempts he disapproved,—saying that the latter attempted to draw up a "connected narrative," whereas the former merely "handed down" the facts. This amounts almost to a denial on the part of Luke that any "eyewitness" (that is to say, apostle) had up to that time written any narrative (so far as Luke knew) of the life of Christ. It implies also that the words and deeds of the Lord had been recorded by many without arrangement, and that the author purposed to arrange them. The literary and artistic purpose of the author appears in words and phrases, as well as in the conceptions. Writing perhaps principally for readers to whom the Greek of the

<sup>1</sup> But possibly this passage is also found in Matt xxi 44

<sup>2</sup> The genuineness of this passage is doubtful

<sup>3</sup> The genuineness of this passage is doubtful

<sup>4</sup> The clause describing the ascension is omitted by Tischendorf

<sup>5</sup> It is very doubtful whether the aorist tense (*ἐπεχείρησαν*) necessarily implies (Westcott, *Gospels*, p. 186) that "St Luke speaks of the 'attempts' as of something which had no influence at the present . . . (attempted, not have attempted)." In the New Testament the proper distinction between the aorist and perfect cannot always be maintained as it can in classical Greek. For example (Mk xiv 9), our A V rightly renders *ἐποίησεν*, "she hath done what she could" and it would seem absurd to say that the aorist *ἐποίησεν* represented an action "which had no influence at the present," in the face of the following words, "Throughout the whole world this also that she hath done (δὲ ἐποίησεν) shall be spoken of for a memorial of her."

original tradition would be in many respects distasteful, he substitutes more classical words for many that are used by Matthew and Mark in the Triple Tradition (see above, p 796). Even the use of "sea" to denote the Lake of Gennesareth, is objectionable to him, and he always substitutes "lake." The Latinism *κοδραντης* for farthing (Mat v 26, Mk xii 42) is altered or omitted by Luke. He prefers *πορευομαι* to *επαγω*. Versed as he is, and as his readers would be, in the metamorphoses of the heathen stories, he shrinks from applying the word "metamorphosed" (Mat xvii 2, Mk ix 2) to the transfiguration of Jesus, and substitutes (ix 29) "became different." He dislikes repetitions also, as much as he dislikes low class words. Compare v 32, 33, vi 10, viii 21, 15, with the corresponding passages in Matthew and Mark, and note especially, in the cure of the palsied man (Mat ix, Mk ii, Lu v) how Luke not only avoids the word *κρᾶββατος*, for "bed" (noted by Phrynichus as objectionable, Lobeck, p. 62), but also, to avoid repetition, uses three substitutes in succession, —(v 18) *κλινης* (v 19 and 24) *κλινιδι*, (v 25) *ἐφ' ᾧ* (or *δ*) *κατέκειτο*, where Mark is content to use the objectionable *κρᾶββατος* four times. When writing in his own style he is fond of long and sonorous words, such as *διαδος* for *δος* (Mat xix 21, Mk x 21, Lu xviii 22), *διαμερίζομαι*, *διαγογγύζειν*, and the compounds of *δια* generally, compare also his use of *περιποιούμαι* (xvii 33, correct text), and of *ζωογονεῖν* (xv) for *σωζειν*.

The style  
of Luke

The question of Luke's style is specially important because the striking differences between certain portions of his Gospel which are all, though in very different styles, found in his Gospel alone (occurring neither in the Triple Tradition, nor in the parts which Luke has in common with Matthew or in common with Mark), might naturally induce even a careful student to believe that they are composed by different authors. For example, take as a criterion the use of *καί* and *δέ*. In classical Greek, and indeed in almost every Greek except the ultra Hebraic, the particle *δέ* is of constant occurrence. The fact that it does not occur more than six or seven times in the whole of the Apocalypse, and not at all in the first book of the Maccabees till chap. iii 36, would naturally lead us readily to believe that the former was written by a Jew who knew little of Greek literature, and that Jerome was right in saying that the latter is a translation from a Hebrew original. Applying this test to Luke, we find that in the 80 verses of Luke's first chapter, it occurs 16 times, while in the 19 verses of x 25-42 it occurs 16 times, or in other words, *δέ* is (proportionately) used more than four times as often in the ninth chapter as in the first. This suggests the inference that Luke's introduction has an Aramaic origin. But if we turn to the Acts we find that in the first chapter, containing 26 verses (or 19 verses of narrative and 7 of a speech), *δέ* occurs only twice, whereas in the ninth chapter, which contains 43 verses, *δέ* occurs 35 times. Yet an Aramaic origin has not been thought, by any consensus of competent authorities, necessary or probable for the first chapter in the Acts.

Although, therefore, it is possible that the first two chapters of Luke may be a direct translation from an Aramaic original, yet there is an alternative. The alternative is that Luke, a man of letters and skilled in composition, consciously or unconsciously adapted his style to the subject, feeling that a different style was required on the one hand by the Magnificat and the Nunc Dimittis, and on the other hand by the graceful domestic narrative of the contrast between the sisters Martha and Mary.

This will be made all the more probable if it can be shown that Luke had studied and imitated the LXX, and in particular the Greek Apocrypha. Words not used (or seldom) by Matthew and Mark, but by Luke and the Apocryphal writers, are *ἐπιβλεψόν*, *ἀποσπασθέντων*, *ἐπιβάλλει* in the sense of "belonging," *ἐπισιτισμός*, the use of *ὕψιστος* for God, *στιγμή*, *ἀντιβάλλειν*, *εὐθετος*,

*περισπᾶσθαι*, *καίρως ἐπισκοπῆς*, *δοχή*, and *λυσitteλεῖ*. But far more striking than mere words (for Matthew and Mark might be shown to have some peculiar words in common with the Apocrypha) are the sentences in the Apocrypha which seem to have suggested similar sentences in Luke. For example, compare Luke's story of the rich fool (xii 19) with the following passage from Sirach (xi 18). "There is one that gathereth wealth from his overheard and pinching, and this is the lot of his reward. In the hour when he saith, I have found rest, and now let me eat of my good things, even then he knoweth not what season shall pass away, and he shall leave these things unto others and shall perish." Again, in the parable of the unjust judge there is a striking similarity between the words (xviii 8). "Though he bear long with them (*μακροθυμεῖ*), I tell you He will avenge them speedily, and (*σὺ* xii 22), 'And He will surely not delay, nor will He bear long (*μακροθυμήσει*) with them' so also between (i 42) 'Blessed art thou among women, and (*σὺ* Judith xiii 17) 'Blessed art thou, O daughter, by the Most High God, above all the women that are in the earth', and between (vi 35) 'Love ye your enemies and ye shall be the children of the Highest, and (*σὺ* Sirach iv 10), 'Be as a father unto the fatherless and thou shalt be as the son of the Highest. Occasional similarities of thought and even of words are found between Matthew and Mark and the LXX Apocrypha, but it cannot be said of either of them, as it can of the Third Gospel, that it is saturated with the LXX diction. In many cases there is an allusive use of LXX words. For example, Luke (xxiii 51) telling us that Joseph of Arimathea had not "consented to" the wicked decision of the Pharisees against Jesus, uses a word not elsewhere used in the whole of the New Testament. Why? Because the word is used by the LXX (Exod xxiii 1) in a passage expressly prohibiting combinations for false judgment. 'Thou shalt not consent with (*συγκαταθήσῃ*) the unjust to become an unjust witness, thou shalt not be with the stronger side to do ill, thou shalt not add thyself with the multitude to shut out judgment.' Again, when Luke (xxiii 49), telling how the "acquaintances of Jesus stood at a distance from the cross, uses the word "γνωστοί" —not elsewhere found in the synoptists,—there can be little doubt that he has in his mind the passage from the LXX (Ps lxxvii 9), "Thou hast put mine acquaintances (*γνωστούς*) far from me. Compare also the use of *εγκαθεύς*, only found once in Luke (xx 20), with the use of the word in the LXX (twice only) Job xix 12, xxxi 9. See also a similarity implied between the aged Abiahm and Sarah on the one hand, and Zacharias and Elisabeth on the other, in the similarity between "προβεβηκότες ἡμερῶν" (Gen xvi 11) and *προβεβηκότες ἐν ταῖς ἡμέραις* (Lu i 7).

Our conclusion must be (1) that as Luke has modified the Triple Tradition, and the words of the Lord common to himself and Matthew, by alterations of words and phrases, so and much more has he modified other traditions or documents which he has introduced into his work, and (2) that those portions of the part of the Gospel peculiar to himself which have a more archaic and Judaic rhythm and vocabulary than the rest may be either translations from Aramaic documents, or imitations, conscious or unconscious, of the books of the LXX,—natural adaptations of the style to the subject, like the language of Shakespeare's *Julius Caesar* as compared with the less simple and dignified language in his English plays of the same date. It is probable, however, that when the evidence is more thoroughly classified than it has hitherto been, it may at least demonstrate the existence of different documents in Luke, whether translations or not.

Impossible though it is here even to summarize the evidence, we may give the reader a conception of the nature of it. Attention has been called above to the use of the form *ὁ Κύριος*, "the Lord," in narration, as being an indication of late authorship. But this form occurs several times in the body of Luke's Gospel, namely, in the passages containing the raising of the widow's son at Naim (vii 13), the appointment of the seventy (x 1), the rebuke of the Pharisees (xi 39), the preface to the parable of the faithful and just steward (xii 42), the healing of the daughter of Abraham bound by Satan (xiii 15), the parable of the sycamore tree (xvii 5, 6), the parable of the unjust judge (xviii 6), the story of Zacchæus (xix 8), warning to Simon Peter (xxii 31), Christ's look (xxii 61), and the verse where it is said that they found not the body of the Lord Jesus (xxiv 3). Many of the above passages certainly show signs of translation, and when we remember that the Gospel of the Hebrews (see below, p 818) always uses the form *ὁ Κύριος*, and never *ὁ Ἰησοῦς*, we see herein a confirmation of the theory that these passages in Luke are translations from Aramaic. Another testing word is *ἱεροσολάημ*. Luke uses *ἱεροσολάημ* about twenty-six times, *ἱεροσόλυμα* only three times (ii 22, xix 28,

xxiii. 7). It has been shown above that the latter form is sometimes used geographically by writers who use the former rhetorically or historically; but it is certainly remarkable that in ii. 22 and 41 the two forms should be used, apparently in the same sense, ἀνήγαγον αὐτοὺς εἰς Ἱερουσόλυμα and ἐπορεύοντο . . . εἰς Ἱερουσαλήμ. Many other test words might be mentioned, the converging evidence of which, added to the internal evidence of thought (and perhaps corroborated by the evidence of special forms, e.g., ἤλθαν for ἦλθον), may possibly hereafter enable future critics to distinguish with certainty between the different strata of Luke's narrative. But no certainty is possible in the present condition of the evidence. There has been abundant labour but insufficient classification of evidence, and no attempt at all to represent it in a concentrated form.

Peculiarities of Luke's Gospel.

Passing now to the consideration of Luke's additional subject matter, and reserving the supernatural element to the last, we will speak first of the doctrine. The key-note is struck in the song of Zacharias, and repeated in the first sermon of Jesus in Nazareth. The object of the messenger of Jesus is (i. 77) "to give us knowledge of salvation" by "the remission of sins," by reason of "the tender mercy of our God, whereby the dayspring from on high hath visited us to give light to them that sit in darkness;" and the object of Jesus Himself (iv. 18) is "to preach the gospel to the poor," to "heal the broken-hearted, to preach deliverance to the captives, and recovering of sight to the blind." All through the Gospel (or at least the parts peculiar to Luke) there appears to a greater degree than in the First or Second Gospel the contrast between light and darkness, God and Satan, sin and remission of sins, culminating in the triumph of forgiveness and mercy; so that in the very last words of Jesus to His disciples (xxiv. 47) the proclamation of "repentance and remission of sins" is made the prospect of the future gospel to all nations.

The law of Moses appears at first sight inconsistently magnified, almost in an Ebionitic spirit, throughout the first two introductory chapters of the Gospel, and afterwards put aside. But there is no inconsistency. Paul himself says that the Saviour placed Himself at His birth "under the law," and hence it is that Luke, with an almost anxious elaboration, details the exact fulfilments of the law not only by the parents of Jesus, but also by those of His messenger. Hence also it is that in a single chapter of the introduction the word "law" occurs more often than in all the rest of the Gospel put together. For when Jesus attained to manhood, He was no longer under the bondage of the old law, which had now attained its fulfilment in the new law of the remission of sins through love. Yet the law is not trampled on, but only superseded by development; it was only "until John," yet not "one tittle" of it can fail (xvi. 16, 17).<sup>1</sup> True to its principle of contrast, this book gives Satan a prominent position. When Satan departs from Jesus, he departs only "for a time" (iv. 13); Satan causes diseases and binds a daughter of Abraham;<sup>2</sup> Satan is beheld by Jesus in a vision cast down from heaven; he enters into Judas (xxii. 3, not mentioned by Matthew or Mark); he demands the Twelve that he may "sift" them; see above (16), (32), (46), (73). But this need not denote (as is thought by Keim) an Ebionitic source; the same recognition of the ἐξουσία τοῦ σκότους appears in the Acts and the Epistles to the Ephesians and Colossians, which no one suspects of Ebionitic tendencies (Lu. xxii. 53; Acts xxvi. 18; Eph. ii. 2; vi. 12; Col. i. 13). Something more than the principle of contrast may, however, be required to explain the sharp demarcation between rich and poor. We do not find in Luke that qualification of the

epithet "poor" which Matthew (v. 3) inserts, "the poor in spirit." He enforces the hampering disadvantages of wealth, pronouncing a woe upon them that are rich; gently rebukes the "cumbered" Martha; exhorts the rich to entertain the poor; and dooms the rich fool to a sudden and disappointing death, while Dives is consigned to unalterable torment,—(21), (34), (46), (51), (57). But if this seems to savour of Ebionitic thought, let it be remembered that the principle of contrast is even more systematically applied to illustrate the power of the genuine Pauline faith in the parables of forgiveness. As Lazarus is contrasted with Dives, and the grateful Samaritan with the ungrateful Jewish lepers, and the merciful Samaritan with the heartless priest and Levite, and even the trivial anxieties of Martha with the simple devotion of Mary,—so in the stories of forgiveness, the publican finds his foil in the Pharisee who prays by his side; the woman "which was a sinner," and who "loved much," contrasts with Simon, the churlish host, who loved little; the prodigal younger son with the envious elder son; and the penitent thief on the right with the impenitent thief on the left. All these stories, as well as the tale of Zacchæus, and the lost piece of silver, and the lost sheep (peculiar to Luke in language, though the same subject is found in Matthew), magnify the power of forgiveness, and repentance, and faith, for the most part "without works"—contrasting the instantaneous and complete victories of emotional faith with the inferior results of a long life of ordinary and prudent respectability,—(27), (54), (55), (81), (66), (64).

The universality of the Gospel is more marked in Luke than in Matthew or Mark. The seventy missionaries appear to be emblematic of the preaching of the gospel to the seventy (or seventy-two, see Westcott's *Introduction*, p. 374) nations of the earth. The preference of the Gentiles to the Jews would seem to be indicated at the very outset of the public life of Jesus in the sermon at Nazareth (iv. 16-30), if we could accept this as chronologically and historically accurate. Besides the statement of Jesus in the Triple Tradition, that His kinsmen were those that heard the word of God and did it (Luke prefers this expression to that of Matthew and Mark, "doing the will of God"), Luke gives us another assurance that God's special blessing is reserved, not for the mother of the Saviour, but for those who do the word of God. The inclusiveness of the author breaks down the barrier between Jesus and the Samaritans; the sons of Zebedee are rebuked for desiring to call down fire on a Samaritan village; a just Samaritan shames both priest and Levite; and a grateful Samaritan puts nine Jewish lepers to the blush,—see (31), (17), (39), (29), (33), (59).

In connexion with this, the gentler and more inclusive side of the gospel teaching, it may be mentioned that Luke lays especial stress on the part played by women alike in discerning the providence of God, in ministering to Jesus, and in eliciting some of His most helpful utterances. The songs of Mary and of Elisabeth, and the testimony of the prophetess Anna, are found nowhere but in the Third Gospel; in Luke, for the first time, the mother of the Lord begins to assume a wider province,—she it is, and not Joseph, that ponders in her heart the words of her divine Son, and her sufferings are made the subject of inspired prophecy (ii. 35). Luke alone thinks it worth while to record at some length the names of those women who accompanied Jesus and contributed to His support; he alone knows of the devoted faith of Mary and the domestic anxieties of Martha; he alone records the cure of the afflicted "daughter of Abraham," the truth-eliciting exclamation of the woman who invoked a blessing upon the womb that bare Him, the story of the woman who "loved much," and the parable of the woman rejoicing over the lost piece

<sup>1</sup> Compare the strong language of Luke xvi. 16, and the contrast there between the "law" and the "kingdom," with the similar but much weaker language in Matt. xi. 12, 13, where the contrast is almost lost.

<sup>2</sup> Note that Luke alone in the description of the cure of Simon's mother-in-law (iv. 39) tells us that Jesus rebuked the fever.

of silver. Luke alone holds up the fate of Lot's wife as a warning; nor do we find in any other Gospel the touching utterance of Jesus to the weeping "daughters of Jerusalem." The other synoptists concur with Luke in pronouncing a blessing on the man who gives up father or mother or lands or houses for Christ's sake, and the sense of fitness has induced the scribes of several MSS. to insert in Matthew and Mark the word "wife" as well as "mother"; but it has no legitimate place except in the version of Luke. It is true indeed that Luke, so far from giving to women the prominent part assigned to them by Matthew and the interpolated Mark, and even by the Fourth Gospel, in attesting the resurrection of Jesus, carefully places their evidence in the background; but the evidence of impressionable witnesses might naturally be subordinated by a writer (perhaps a physician too) who was collecting the traditions of the church into an historical narrative. In any case, it is noteworthy that the word "woman" occurs in Luke almost as many times as in Matthew and Mark put together.

Probably the most perplexing part of Luke's doctrine is found in the parables of the unjust steward, the unjust judge, and the friend persuaded by importunity. In the last two of these the argument appears to be,—“If an unjust or indolent man can be goaded by importunity into granting requests, much more will assiduous prayer prevail with the Father in heaven;” in the first, “If the fraudulent show forethought in providing for their earthly future, much more should the children of light show forethought for their eternal future.” Although it is quite possible that our Lord drew a contrast (with something of irony) between the single-mindedness of earthly ambition and the scattered energies of those whose aim is righteousness, yet it is difficult to believe that He uttered these parables in their present shape, or that they are entirely free from misunderstanding. The last two of these three parables (as they stand) seem at variance with His teaching in prayer, which bids us remember that the Father knoweth what things we need before we ask them; and the right moral to be drawn from the unjust judge would seem to be, “Although the unjust judge may be won by importunity, do not suppose that importunity can prevail with the just Judge.” It is to be observed, however, that the language and style of these parables (differing from that of the Triple Tradition) make it somewhat improbable that we have here in Luke's narrative the exact words of Jesus, see (36), (56), (62). As regards the great day and the coming of the Lord, Luke appears to distinguish (more than Matthew and Mark) between the ultimate coming and the fall of Jerusalem, which was to precede it. As Luke distributes the discourses which Matthew connects with the twelve into two parts,—one connected with the twelve and the other with the seventy,—so he distributes the discourse on the coming (which Matthew reports as one continuous discourse uttered at Jerusalem) into two parts,—one uttered at Jerusalem, and dealing principally with the fall of Jerusalem (xxi. 6–38), the other uttered on the way to Jerusalem, and expressed in more general terms (xvii. 20–37). As a preparation for the coming, Luke lays stress on constancy and directness of purpose. No man who puts his hand on the plough must look back (30); better not to begin the tower than leave the tower unfinished (53); remember Lot's wife (61). The coming is spoken of as possible at any moment—suddenly and without observation (60); and the disciples are exhorted to wait as servants for their master, with their loins girded (41 and 42), avoiding surfeit and drunkenness (71). When the master or king returns, ignorant disobedience will be less severely punished than the disobedience of knowledge (42); and those who have not increased the “mina” or pound intrusted to them, will be less severely punished than the rebels (65), who will be slain.

Luke (like Matthew and Mark) predicts a time of trouble; but he sees somewhat clearly, beyond it, the dawn which is to precede the rise of the kingdom. Destruction falls, not by chance, but on all that do not repent (45); all must strive to enter the strait gate (47), for not those that were first called shall enter in (52). Much more clearly than in Matthew and in Mark is the future fall of Jerusalem described, as the result of a *siege* and capture; and the slaughter of the citizens, the scattering of the nation, and trampling down of the city are mentioned, with details for which we vainly look in the first two Gospels (59). It is not concealed that the disciples have much tribulation in store, and that they must use all prudence to protect themselves (74). But a term is set for all these troubles; Luke (omitting the remarkable saying of Matthew and Mark that the Son Himself knoweth not “the hour”) declares that the trampling down of Jerusalem will be only till “the times of the Gentiles are fulfilled.” Then will come a time of “distress,” not, however, now for Israel but for the Gentiles (69); and amidst convulsions of nature the Son of Man will come. In the hope of this coming, the disciples are to lift up their heads (70), remembering that not a hair of their heads will be injured (68). Certainly the comparatively cheerful tone of the discourse on the coming, combined with the joyful and triumphant tone of the first two chapters of Luke's Gospel, indicates an author writing at a time when the fall of Jerusalem was an accepted fact, and the establishment of a new and spiritual Jerusalem recognized as a sufficient consolation,—a time when the church, not yet troubled by systematic persecution or by serious desertion (Keim, *Jesus of Nazara*, Engl. ed., vol. i. p. 96), was still sanguinely looking forward to the moment when the times of the Gentiles should be fulfilled, and the Son of Man should suddenly come.

The supernatural narratives peculiar to Luke, and found in the main body of his treatise, are the miraculous draught of fishes, the raising of the widow's son at Nain, the healing of the woman bound by Satan, the cure of the dropsical man, and the appearance of the angel strengthening Jesus,—(18), (25), (46), (49), (75). The first two suggest to many minds a symbolical interpretation, and raise the question whether they (and possibly some of the other miracles) may be emblematical rather than historical. This question cannot suitably be discussed in these pages; but one or two observations may be made. That Jesus wrought instantaneous cures cannot be contradicted, being proved by the whole texture of the Triple Tradition, as well as by the indirect testimony of Paul. That He also had the power of raising the dead no Jew could well doubt or dispute. Elijah had raised a child from the dead, still more notably Elisha, even when dead himself; some (interpreting the prophet literally) said that Ezekiel (Ez. xxxvii. 7) had done the same. But whatever the inferior prophets had done He who was at once *the* Prophet and Messiah could not fail to do. Still less could heathen converts suppose that Jesus was inferior in power to Æsculapius. It was therefore certain that, whether the traditions and books of the church contained or omitted any record of a raising from the dead, the church would believe from the first that Jesus possessed and employed this power. Different readers will give different weight to the considerations for and against the authenticity of Luke's narrative of the raising of the widow's son. Many will be so far influenced by the extreme beauty of the story (and perhaps by the fact that the custom of early burial among the Jews might reduce this, like the case of Jairus's daughter, to the level of natural though marvellous events) as to believe that in it we have, not legend, but history; but no one who can weigh evidence at all will maintain that the evidence for this miracle is equal to the evidence for the

raising of Jairus's daughter. Luke's other principal miracle, the draught of fishes, is also considered by many to have arisen from metaphor misunderstood. It is connected by Luke with the calling of Simon Peter, an incident mentioned both by Matthew and by Mark; yet neither Matthew nor Mark describes or gives the slightest hint of any such miracle in connexion with the calling of Peter. In the next place, the metaphor describing the apostles as fishermen and converts as fish, borrowed from Jeremiah perhaps (xvi. 16), is applied by our Lord both to the apostles, as "fishers of men," and to the preaching of the gospel, which he describes as a "net" catching all sorts of fish, bad and good. As the sea in the Old Testament is regarded as the type of "sin," everything favoured the addition and development of this metaphor. Accordingly Philo (*Creation*) describes fishes as typical of the lowest kind of unenlightened existence; and Clement of Alexandria addresses a hymn to Christ, as the fisher of men catching fishes with the bait of eternal life from the hateful wave of the sea of vices (*The Instructor*, iii. 12). It is of course possible that the developed symbolism which we find in Clement may have been entirely the effect, and in no degree the cause, of the narrative in Luke v. 6; and in any case the full discussion of this question would require more space than the limits of this article allow.

The introductory chapters of Luke's Gospel.

Passing now from the main body of Luke's Gospel, we come to the introduction, which name we may give to the first two chapters, describing the birth and childhood of Jesus, and the birth of His forerunner John, the son of Zacharias. The doctrine of the miraculous incarnation, although distinctly stated in Matthew's Gospel, nevertheless required further confirmation. This doctrine appears to have been spoken of from the earliest time, in language which might give rise to different conclusions, according as it was interpreted literally or metaphorically. For example, in the Apocalypse, "the Man Child who was to rule over all nations with a rod of iron" is said to have been born of a woman who was "clothed with the sun, and the moon under her feet, and upon her head a crown of twelve stars," who, after her son had been "caught up into heaven," fled "into the wilderness where she hath a place prepared of God" (Rev. xii. 1-6). It seems certain that the writer represents by the woman, not the Virgin Mary, but the Church—the Spiritual Israel; and in later times the letter of the Church of Lyons (Euseb., *H.E.*, v. 1) speaks of the "Virgin Mother" as having her children restored to her from the dead (meaning that the church received back, as martyrs, those who had first recanted and then renounced their recantation). Justin Martyr also protests that, even though he should not be able to prove the pre-existence of Jesus, and even though it should appear that He was born man of men, yet it would still be true that He is Christ; "for," adds he, in his dialogue with Trypho (chap. xlviii.; or, ed. Morell, p. 267), "there are some, O my friends, of our race,<sup>1</sup> who confess Him to be Christ, but who declare that He is man of men, to whom I do not assent: nor would very many that have formed the same opinions as I have say as they say, because we have been commanded by Christ Himself not to follow the teachings of men, but the proclamations made by the blessed prophets, and taught by Him." The expression "not very many" (οὐ πλείστοι) indicates that (a) even in Justin's time (150 A.D.) a large though not very large number of Christians in Samaria or Judæa believed that Christ was the son of Joseph, and that (b) a principal part of the evidence for the contrary belief was based upon "the proclamations of the prophets." On the other side, what

germs of wild and fanciful doctrine were in the air may be inferred from the Gospel of the Hebrews, which will not allow that Jesus had even a human mother, but speaks of His mother as being the Holy Spirit (Kirchhofer, p. 451, and cf. p. 454). In opposition to these divergent but heterodox beliefs, it became increasingly necessary to maintain the doctrine that Jesus was at once a man, born of a human mother, and divine, born of the heavenly Father; and this needed to be reaffirmed now, during the prosperity of the church, in a somewhat less apologetic tone than characterized the narrative of Matthew.

When we speak of Luke's "supplying the deficiencies of Matthew," we must not be supposed to mean that Luke had before him, or even knew the existence of, Matthew's Gospel. It has been shown above that he probably knew of no apostolic written narrative (see p. 806 above). Though Matthew's was probably written some years before Luke's Gospel, very many years might elapse before a treatise used in one church or province might be recognized as authoritative beyond its original boundaries. But by "supplying the deficiencies" we mean that the conscience and faith of the church required in Luke's time some further and more vivid embodiment of the spiritual truth involved in the incarnation than was contained in the unsupplemented narrative of Matthew.

For example, it was not a sufficient argument against the Jewish slanderers who asserted that Jesus was born of adultery, to say that Joseph, when purposing to put Mary away, was warned by an angel in a dream to give up his purpose. Something more positive, and in a higher tone, not a dream, but an angelic visitation, was needed to confirm the divine origin of the Son of God. Moreover, in order to set forth still more emphatically the subordination of John the Baptist to the Lord, it was needed that the church should know that the prophet (who himself also had his own birth heralded by angels) was from the first acknowledged by his parents as the mere forerunner and messenger of Him that was to come, to whom, even in his mother's womb, the inferior prophet did obeisance. Further, when Jesus was born, it was not enough that wise and learned men from the East should come to worship Him. It was necessary to show that the poor and simple toilers of the earth, typified by night-watching shepherds, were also privileged to behold His glory, and were the first to hear with the ear of faith the divine message of the birth of the Redeemer.

The testimony offered to the divine Son of David by Zacharias, who represents the priestly tribe of Levi, and by Elisabeth, who was one of the daughters of Aaron,<sup>2</sup> and the blessing of Simeon, and of Anna who is said to have been of the distant tribe of Asher,—all this emblematic homage from Israel to its Redeemer would be inadequately replaced by Matthew's brief story of the flight into Egypt; and, although refusing to feed a frivolous curiosity with frivolous legends on the childhood of Jesus, the church would naturally cherish the story which told how the youthful Redeemer, when missed by Mary and Joseph, was found in His Father's house. A narrative of this kind, not vulgar nor colloquial, and yet not too refined or scholastic, but framed both in language

<sup>1</sup> Another reading *ὑμετέρον* would make Justin refer to Jewish Christians; but the inference would remain unaffected.

<sup>2</sup> The importance attached to the co-operation of Levi with the "Lion of the tribe of Judah" is clearly seen in the very early (before 135 A.D.) apocryphal book entitled *The Testaments of the Twelve Patriarchs* (Sinker, p. 104), in which "Christ is spoken of as coming forth from the two tribes of Judah and Levi, as typical of His twofold office of King and Priest." The symbolism of Origen, as regards Zacharias and Elisabeth is far more fanciful; he sees (*In Evang. Joann.*, ii. 27) in the meanings of Elisabeth ("the oath of my God") and Zacharias ("memory") a reference to the birth of John ("the gift of God"): "ἐκ τῆς περὶ θεοῦ μνήμης κατὰ τὸν τοῦ Θεοῦ ἡμῶν Ὀρκον τὸν περὶ τοὺς πατέρας" (Luke i. 73).

and in thought on the model of the best Greek Apocrypha, setting forth in the sacred vocabulary of the LXX. the earliest Christian psalms and hymns that had been committed to writing, would be justly felt by all the churches to tend to edification, and would soon find a place in every assembly for Christian worship.

But the resurrection, even more than the incarnation, required amplifications. If Matthew had left gaps in his introduction, still more serious were the deficiencies in his appendix to the traditional gospel. Although Matthew had added something to the mere suggestions of a resurrection contributed by Mark, he had not added enough. More proof was required, tangible proof, if possible. The women, it is true (according to the narrative of Mat. xxviii. 9), had held Jesus by the feet, but the disciples themselves were not recorded to have done so; and, besides, the increasing reverence of the church shrank from the thought that the body of the risen Saviour had been actually touched (Jo. xx. 17), even though He might have offered Himself to the touch of His disciples. As far therefore as the evidence went, it was open to the Jewish sceptic to call the manifestations of the Lord delusions, or at best visions, and to apply to them the words of the angel (Tobit xii. 19): "All those days I did but make myself visible unto you, *and did neither eat nor drink*; but ye beheld a vision." Against so formidable an objection, no proof could better commend itself to a close student of the LXX. (such as Luke assuredly was) than a narrative describing how Jesus ate in the presence of His disciples (xxiv. 43). Again, whereas the conclusion of Matthew's narrative leaves Jesus (except by inference) still on earth, Luke omitting the apologetic details which had now become unnecessary, or even liable to perversion (*e.g.*, the Jewish slander that the Lord's body had been stolen from the sepulchre, and the fact that some of the eleven disciples "doubted" when they saw the Lord, apparently for the last time, upon the mountain), describes how Jesus was not parted from His disciples till He had produced complete conviction in all of them, and had opened their minds to understand the scriptures.

Still, even with these important additions, the appendix of Luke seemed to some, and perhaps to Luke himself, incomplete; and, accordingly, either Luke himself, or some early editor or very early scribes, inserted in the appendix several further additions:—(1) that Peter saw the grave-clothes of Jesus lying in the open tomb (xxiv. 12);<sup>1</sup> (2) that Jesus proved His identity to His disciples by showing them His hands and His feet; (3) that He fed not only on the emblematic "fish" but also on the "honeycomb" (xxiv. 42); and lastly, (4) that He ascended into heaven (xxiv. 51). Perhaps the same hand added, in the account of the agony at Gethsemane, the description of the angel from heaven who appeared strengthening Jesus, and of drops as it were of blood falling from Him to the earth. It is by no means improbable that Luke himself added these passages in a later edition of his own work, as authoritative traditions which had subsequently become known to him; and two or three of them, in somewhat different shapes, will present themselves to us subsequently in the Fourth Gospel.<sup>2</sup>

<sup>1</sup> It is most improbable that this passage has been interpolated in Luke from the Fourth Gospel (xx. 4-7); for the passage in the Fourth Gospel is fuller than in Luke, and the tendency of copyists is rather to amplify than to curtail. Besides, there are traces that Luke and John are both different versions of the same tradition, differently understood.

<sup>2</sup> Unless these additions were made by some authoritative hand, it is not easy to see why they should have been adopted by so many of the best MSS.; no such additions are found in the appendix of

*Language of the Original Tradition.*—It is probable that the Jews, and more especially those in Galilee, were (like the Welsh in the present day) bilingual; and the question has therefore been raised whether our Lord, in His teaching, spoke Greek or Aramaic. If He spoke Greek, then the Aramaic words *Talutha cumi* and *Ephphatha* (Mk. v. 41; vii. 34) must be supposed to be specially addressed to the young and the illiterate, who would best understand the national dialect. But the names Cephas, Boanerges, given by our Lord to His Galilean disciples, and the use of Aramaic in His own prayer ("Abba, Father"), and in His last utterance (as recorded by Mat. xxvii. 46; Mk. xv. 34), indicate that both for Himself and for His disciples Aramaic and not Greek was the natural tongue. Although therefore it cannot be denied that Greek, even in Jerusalem (see Acts xvii. 2, indicating that Greek would have been understood, though they preferred "Hebrew"), was generally intelligible, yet the scanty evidence derivable from our Lord's words is that He habitually used Aramaic.

The testimony of Josephus tends in the same direction. He, though a man of education, composed certain books first in his own tongue (pref. to *Wars*, 1). He also tells us that he found it a laborious task to render the history of his country in Greek, "an alien and strange language" (pref. to *Antiqu.*, 2). It is to be presumed that he wrote in Aramaic partly for his countrymen in Judæa; but he adds that it was also for the sake of "Parthians, Babylonians, and remotest Arabians, and those of our nation beyond Euphrates, and the Adiabeni" (pref. to *Wars*, 2). Making every allowance for exaggeration, we are justified in drawing from the fact that Josephus thought it worth while to compose books first in Aramaic the inference that a large number of readers in the East would be more likely to read Aramaic than Greek.<sup>3</sup>

But it has been thought that the use of the LXX. in our Lord's quotations from the Old Testament shows that He spoke Greek. The answer is—(1) Even if all the quotations in the synoptists from the Old Testament exactly agreed with the LXX., the agreement would by no means prove that our Lord used the LXX.; for, in translating Hebrew into Greek, the translator might naturally translate the Hebrew quotations from the Old Testament into the corresponding LXX. version, to which his readers were accustomed. This he might do, even though the LXX. did not quite accurately represent the Hebrew; just as, in translating into English a Latin book, with quotations from the Vulgate, we should naturally use our English version, without considering whether the English exactly represented the Latin. (2) But, in the second place, there is scarcely a single quotation<sup>4</sup> in the Gospels from the Old Testament that exactly agrees with the LXX. when the LXX. differs from the Hebrew; and many of the quotations differ slightly both from the

Matthew. Again, unless they are additions (not forming a part of the first edition of the Gospel), it is hard to see why any of the best MSS. should omit them, since they would recommend themselves to all readers and copyists.

<sup>3</sup> The statement of Josephus (*Contra Apion.*, i. 9), that "he alone understood (*μόνος αὐτὸς οὐκ ᾔδει*)" the information brought to the Romans by deserters from Jerusalem during the siege, must be regarded as a piece of bombast. For is it credible that a Roman army before a besieged city should have had with it no other interpreter besides one recently captured prisoner? Nevertheless, this exaggeration may be taken as an indication that the lower classes in Jerusalem could not, as a rule, speak Greek; for Josephus assumes this, as a matter of course. Greek, of course, would have been perfectly intelligible to any educated Roman if the deserters had been able to speak it.

<sup>4</sup> An exact illustration may be derived from the Latin translation, by Rufinus, of the *Clementine Recognitions*, in which (Sanday, *Gospels*, p. 161) "the quotations from the gospels have evidently been assimilated to the canonical text which Rufinus himself used."

The language of the original tradition.

Hebrew and from the LXX., and even from the same quotations as elsewhere occurring in the New Testament. And this is just what we might expect. A Hellenist, translating a Hebrew document into Greek (in times when reference to books was far more cumbrous, and trust to memory far more common, than with us) would be likely to be guided principally by his memory of the LXX., but partly by the Hebrew before him. Hence would result translations slightly varying both from the Hebrew and from the LXX., and from other translations made by contemporaneous writers. This argument is, of course, unaffected whether the translation was originally made in a document or, as is more probable, in an oral tradition.

Some confirmation of this hypothesis is derived from the fact that, although the first book of Maccabees was without doubt originally written in Hebrew, yet the quotations in it from Scripture are not translations from the Hebrew version. On the contrary, if the quotation in 1 Mac. vii. 17 from Ps. lxxviii. (lxxix.) 2, 3, be compared with the latter passage in the LXX, it will be seen at once that the former, though not identical with the latter (nor with the Hebrew), could not have been written but by a writer familiar with the LXX. version, compare also 1 Mac. ix. 23 with the LXX. version of Ps xci. (xcii.) 8. A similar inference would seem to be justified by the statement (De Wette, quoted by Roberts, *Discussions on the Gospels*, p. 50) that Josephus uses the LXX. more than the Hebrew text.

The hypothesis of translation.

Mistranslation of an Aramaic original may possibly explain in part some of the confusions in the common tradition noted above (p. 791). It cannot of course be denied that some of these confusions imply a confusion of Greek, not Hebrew, tradition (e.g., ἁγγελοῖ, Lu xx 36, ὡς ἀγγελοῖ, Mat xxi 30, Mk xii 26), but some of the changes of construction (e.g., πᾶσα ἡ περιχώρας ἐξεπορεύετο, Mat. iii 5 and Lu iii 3, ἦλθεν εἰς πᾶσαν τὴν περιχώραν, Mk i 5) are more easily explicable on the hypothesis of translation. Some of the changes of words are also explicable thus, as may be illustrated by the Latin version. Commenting on the text, "Domine, ne in ira tua aigas me, nec in furore tuo corpias me," Augustine (Ziegler, p. 10) says that in some codices of the Latin translations "ira" stands first, and "furore" second, in others "furore" first and "ira" second. Compare with this Mat v 40, τῷ θελοντι λαβεῖν χιτῶνα ἕψες αὐτῷ τὸ ἱμάτιον, and Lu vi 29, τοῦ αἰρόντος σου τὸ ἱμάτιον μὴ κωλύσης τὸν χιτῶνα, where the phenomena are precisely the same, and note that Mat (xxvii 65) has ἱμάτια, where Mk (xiv 63) has χιτῶνας. Of somewhat the same type (perhaps) are the passages Mat vi 16, ἀπὸ ἀκανθῶν σταφυλῆν, and Lu vi 44, ἐκ βάλτου σταφυλῆν.

In the translations from Greek into the early Latin versions of the New Testament, one very common difference is (besides divergent rendering of single words) that one version uses participles where the other uses finite verbs, or relative pronouns where the other uses co-ordinate conjunctions.<sup>1</sup> These same slight differences are found in several sayings of our Lord where they happen to be twice recorded by the same evangelist. Compare (a) Lu viii 18, ὃς γὰρ ἂν ἔχη, and Lu. xix 26, πάντι τῷ ἔχοντι (see also Mat xiii 12, xxv 29), (b) Lu viii 17, οὗ γὰρ ἐστὶν κρυπτόν δὲ οὐ φανερόν γενήσεται, and Lu xii 2, οὐδὲν δε συγκεκριμένον ἐστὶν δὲ οὐκ ἀποκαλυφθήσεται (see also Mat. x 26), (c) Mat x. 39, ὃ εὐρὼν τὴν ψυχὴν αὐτοῦ ἀπολέσει αὐτήν, καὶ ὃ ἀπολέσας τὴν ψυχὴν αὐτοῦ ἔρεκεν ἐμοῦ εὐρήσει αὐτήν, and Mat x. 25, ὃς γὰρ εὐρὼν θέλη τὴν ψυχὴν αὐτοῦ σώσαι ἀπολέσει αὐτήν, ὃς δ' ἀν' ἀπολέσῃ τὴν ψυχὴν αὐτοῦ ἔρεκεν ἐμοῦ εὐρήσει αὐτήν (and cf Lu ix 24, xvi 25), (d) Mat v 32 πᾶς ὃ ἀπολύν τὴν γυναῖκα αὐτοῦ, &c., and Mat xix 9, ὃς ἂν ἀπολύν, &c. (e) In the same two passages there appears to be a confusion between "causeth to commit adultery" and "committeeth adultery."—Mat v 32, παρεκτός λόγου πορνείας, ποιεῖ αὐτὴν μοιχεύειν, and Mat xix 9, μὴ ἐπὶ πορνείᾳ . . . μοιχεύαται, (f) Mat v. 32, ὃς εὐρὼν ἀπολελυμένην γαμήσῃ, and Mat xix 9, ὃ ἀπολελυμένην γαμήσας. These passages, so far as they go, would indicate that the compilers of the

<sup>1</sup> Compare the Codex Corbeiensis and Brixianus (Migne, *Patrologiae Cursus Compl.*, vol. xii p. 147); of which (1) the former has (Mat. ii 7) "Tunc Herodes, clam vocatis Magis diligenter didicit ab eis tempus stellae quae apparuit eis, et mittens illos in Bethleem, dixit 'Ite et interrogate'" &c.; while the latter has (2) Tunc Herodes occulte vocans Magos diligenter exquisivit ab eis tempus quando apparuit eis stella, et misit illos in Bethleem, dicens, 'Euntes requirite,' &c.

First and Third Gospels did not themselves translate from Aramaic originals; for if they had themselves been the translators, it would seem that they would have adopted a uniform rendering in translating the same or very similar words. Limited though the evidence is, it goes to prove that the compilers incorporated in their treatises Greek translations, not all made by themselves, from Aramaic originals.

The phenomena of the ante-Jerome versions of the New Testament deserve careful consideration in discussing the possible origin of our Greek synoptic tradition from an Aramaic original. In a well-known passage, Jerome (Ziegler, *De Laternischen Bibelübersetzungen vor Hieronymus*, p. 12) complains that there were as many texts as copies of the Latin versions ("tot sunt enim exemplaria poene quot codices"), and the occasionally great variety may be illustrated by comparing an extract from the Codex Bobbiensis (*Jahrbucher d. Literatur* Vienna, 1847, *ad fin.*) with the Vulgate version of Acts xxvii 20, 21—

| BOBBIENSIS                                                                                                                                                                                                                                                                                                                       | VULGATE                                                                                                                                                                                                                                                                                                               |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Neque sole neque stilis apparentibus per multos dies et hinc et tempestate minima [sic] perseverante jam amputabitur spes omnis liberandi nos. Et cum iam jam diu sine cibo essent tunc stans Paulus in medio ipsorum ait Oportu erat quidem vos obedire credentes mihi non navigare de Creta et lucra hanc viam et detrimentum. | Neque autem sole neque sideribus apparentibus per multos dies et tempestate non exigua imminente jam ablata erat spes omnis salutis nostrae. Et cum multa jejunatio fuisset tunc stans Paulus in medio eorum dixit Oportebat quidem, o viri, audire me non tollere a Creta lucraque facere viam istam et detrimentum. |

It will be seen at once that there is some similarity between the thread common to these two Latin versions and the thread common to many passages in Matthew, Mark, and Luke, though the resemblance between any two of the three synoptists would generally exceed the resemblance of the two passages quoted above. In most cases, however, the ante-Jerome versions (as represented by the Codex Corbeiensis, Brixianus, Veicellensis, and Veionensis) agree much more closely together, even more closely than any two of the synoptists agree together, and a portion more closely than the three synoptists agree. On the whole, taking into consideration the greater influence of differentiating causes in the earliest times of the church than in the times when the ante-Jerome versions were composed, we may fairly conclude that if in these later times so great a variety could occur in the process of translation from Greek, the greater variety found in the common tradition, as given by the three synoptists, might well be partly explained in the same way, as originating in part from varieties of translation from Hebrew. But then the questions arise—(a) Were the ante-Jerome versions independent translations from the Greek text? (b) Or were they divergent corruptions of one original Latin translation from the Greek text? (c) Or were they partly independent, but partly modified by some oral tradition or "ecclesiastical use," which diminished the divergence? On these questions there is not at present a complete agreement. Wiseman maintained that the second (b) answer was the right one, but in a recent work (quoted above) Ziegler (p. 123) maintains, with great probability, that the third (c) is correct—viz., that the oral catechizing and preaching in the Latin churches modified and assimilated translations otherwise independent. It is extremely probable that the same hypothesis of combined causes—(1) translations from Aramaic documents, (2) influence of oral Greek tradition—may explain much of the agreement and variation in the passages common to the three synoptists.

The difference between the Triple Tradition of Matthew, Mark, and Luke, and the Double Tradition of Matthew and Luke will, at this stage, occur to us as an important feature in our evidence. The widely different phenomena of the Double and the Triple Traditions suggest different origins for the two traditions. Many of the passages common to Matthew and Luke agree together far more closely than even the Latin versions of the Greek Gospels. It would seem to follow that in such cases Matthew and Luke used one and the same Greek document—a translation of some Aramaic original—which document had not undergone much modification by oral tradition before passing into the several treatises of Matthew and Luke. On the other hand, the more varying language of the Triple Tradition, together with the additions and omissions of the three writers, suggests (a) independent translations of an Aramaic original, (b) occasional resemblances suggested by the general "usus ecclesiasticus"; (c) divergences created by the local "usus ecclesiasticus," or by the individual style of the editor or editors.

*Date of the Synoptic Writers.*—The composite nature of

Date of  
synoptic  
Gospels.

the synoptic Gospels makes it necessary to distinguish carefully between the date of the compilation of each collective treatise and the date of the composition of the several parts of which that treatise may be composed. The original tradition has been shown to have existed before any of the three synoptics; some common document of the words of the Lord has been shown to have probably existed before Matthew's or Luke's narrative; other documents or traditions might also possibly be shown to exist embedded in each of the synoptists, and the date of each of these parts would be earlier than the date of the whole. Therefore, even if the date of Matthew, or Mark, or Luke could be exactly determined, it would by no means determine the date of the traditions which they contain. It is even possible that a later Gospel may retain in some cases an earlier version of the common tradition of the words of the Lord, as we have seen in the case of Luke's version of the Lord's Prayer (see p. 798 above).

There is no internal evidence for exactly determining the date of any one of the synoptics. The supposed references in Mark to the death of James, the capture of Jerusalem, or any special earthquakes which might determine the date (Renan's *Évangiles*, p. 123), are so shadowy as scarcely to deserve consideration. The reference to the death of Zachariah the son of Baruch, shortly before the capture of Jerusalem (Joseph., *B. J.*, iv. 5, 4), supposed to be found in Mat. xxiii. 35, is still more improbable. Still the marked difference between the detailed prediction (in Lu. xxi. 18-25) of the fall of the city and the scattering of the people, and the more general predictions in corresponding passages in Matthew and Mark, indicates that Luke's description is modified by reminiscences of the siege of Jerusalem; while Matthew's and Mark's accounts are not thus, or at all events not equally, modified. It is an almost certain inference that Luke compiled after 70 A.D. As regards Matthew and Mark inferences cannot be drawn with equal certainty; for of course a compiler may compile at a late date, and yet preserve traditions in their earliest shape; but it is at least a reasonable inference that the compilers of the First and Second Gospels wrote before Luke; and there is a balance of probability in favour of the supposition that they wrote before the fall of Jerusalem.

Coming to more general evidence, we find (see p. 791) that (1) Mark, at least in many passages, includes the original tradition from which both Matthew and Luke borrowed; (2) his language, less polished than that of Matthew and Luke, appears more natural for an earlier Gospel in the first and rudest age of the church; (3) Mark's version of the tradition contains many expressions which might naturally be considered "stumbling-blocks," and which, in fact, were rejected or not inserted in the other Gospels; (4) the omission of all account of the manifestations of Jesus after the resurrection indicates a very early date; and though it may be said that this omission arises from the fact that the Second Gospel was accidentally left incomplete, yet this answer will not account for the omission of the genealogies, and of all account of the birth and infancy of Jesus; (5) the interpolated appendix describing the resurrection of Jesus, quoted as it is by Irenæus, shows that even in the time of Irenæus (170 A.D.) the Gospel had been long enough in use to admit of widespread interpolations. All these facts lead to the inference that Mark was compiled earlier than any of the other Gospels, and probably some time before 70 A.D. It is almost impossible to fix any date (worth stating) after which the compilation must have taken place. Those who accept as literally true Mark's accounts of the feeding of the four thousand and five thousand, the walking on the waves, and the exorcism of the Gadarene,

may naturally carry back his history to the first years of the Galilean church; and even those who interpret these accounts symbolically are ready to admit that a very short space of time is often quite sufficient, by misunderstanding and accretion, to erect supernatural narratives on a basis of natural and symbolic story. But any approximation to a date *after* which the Gospel was compiled must be deferred till we consider the external evidence.

The narrative of Matthew does not leave us quite so uncertain. The mention of "the Jews," which is so frequent in the Fourth Gospel, is justly regarded as a proof that the author was writing in times when the Christian church was regarded as definitely and antagonistically separated from the Jewish nation. In the synoptists it is the "Pharisees," not the "Jews," who are in conflict with Jesus. But in his account of the resurrection Matthew (xxviii. 15) uses the word in this antagonistic sense. Further, he twice (xxvii. 8; xxviii. 15) uses the expression "even to this day," of events occurring shortly before or after the death of Jesus,—thereby showing that a long interval had occurred between the death of Jesus and the compilation of the narrative. The tone of the Gospel, as compared with Luke, indicates a period when the Jews still existed as a nation, and when the abrogation of the law and the destruction of the temple were not yet accepted as recognized facts; but the number of parables upon the end of the world and the judgment, the tendency to dwell on exclusion rather than inclusion, on the "many" that are shut out rather than on the "few" that are chosen, and the atmosphere of gloom generally characterizing the Gospel, point perhaps to the crisis immediately preceding the siege of Jerusalem. The additions concerning the birth and incarnation may seem to imply a later date; but when we reflect how natural it was that in very early times the church should attach importance to these subjects, the wonder will be, not that these narratives were written so soon, but that they were deferred to so late a period as forty years after our Lord's death. It is also extremely remarkable—and a mark of early date as compared with Luke—that even in this developed form of the Gospel the accounts of manifestation of our Lord after His resurrection should be so scanty, doubtful, and vague.

In Luke the signs of later date abound:—(1) the pre-existence and implied failure of many "attempts" to set forth continuous narratives of the things "surely believed;" (2) the mention of the "tradition" of the eye-witnesses and ministers of the word as past, not as present (*παρεδόντων*) (i. 2); (3) the dedication of the Gospel to a man of rank (fictitious or otherwise), who is supposed to have been "catechized" in Christian truth; (4) the attempt at literary style and at improvement of the "usus ecclesiasticus" of the common tradition; (5) the composition of something like the commencement of a Christian hymnology; (6) the development of the genealogy and the higher tone of the narrative of the incarnation; (7) the insertion of many passages mentioning our Lord as *ὁ κύριος*, not in address, but in narrative; (8) the distinction, more sharply drawn, between the fall of Jerusalem and the final coming; (9) the detailed prediction of the fall of Jerusalem, implying reminiscences of its fulfilment; (10) the very great development of the manifestations of Jesus after the resurrection. The inference from all this evidence would be that Luke was not written till about 80 A.D. at earliest. If it could be further demonstrated that Luke used any Greek Apocryphal book (Judith, for example), and if it could be shown that the book in question was written after a certain date (Renan suggests 80 A.D. for the date of the book of Judith), it might be necessary to place Luke much later; but no such demonstration has been hitherto produced.

*External Evidence.*

The earliest quotations from the Gospels

The composite nature of the synoptic Gospels will affect the inferences we shall draw from early quotations of passages found in them, where the authors of the Gospels are not expressly mentioned. If, for example, we find in Justin a passage (quoted as a saying of the Lord) which is found both in Matthew and Luke, Justin may indeed have quoted it from Matthew or from Luke, but it is also possible that he may have quoted it neither from Matthew nor from Luke, but either (a) from the common source whence Matthew and Luke derived the passage, or (b) from some other book or tradition, which, like Matthew and Luke, included the passage in its collection or compilation. The same applies to a quotation from the Triple Tradition. It may be quoted from Matthew or from Mark or from Luke, but it is also possible that it may be drawn from none of these, but from the common tradition itself, or from some other treatise based on the Triple Tradition.

Taking the evidence chronologically, we come first to the testimony of Paul, who, in the First Epistle to the Corinthians, says (1 Cor xi 23), "I received from the Lord that which also I delivered to you," and then follows a description of the institution of the Lord's Supper, differing materially from Matthew and Mark, and agreeing in the main with Luke, except that Paul repeats twice the command, "Do this in remembrance of Me." It would seem unreasonable and scarcely reverent to suppose that a special revelation revealed to Paul the exact words of the institution, but comparing the passage with Gal i 9, 12, we see that Paul merely says here about this part of his teaching what in Gal i 9, 12 he says about the whole of it, viz., that he received it from the Lord and not from man. From Ananias, or from other elders of the church, he may have received the words of oral tradition of the church, but for the meaning and spiritual force of it, and the application of each part of it to the work of redemption, he was indebted, not to the elders of the church in Damascus, but to the revelations given to him in the solitude of Arabia. The words of Paul, therefore, do not exclude (and the facts render probable) the use of oral tradition in this passage. This being so, it may seem remarkable that Paul follows the tradition contained in the latest of the three Gospels. It can hardly be that Luke has here preserved the earliest tradition. The insertion of "new" before "testament" (not inserted in the correct text of Matthew and Mark), and the ampler narrative of Luke indicate a later, not an earlier, shape of the tradition. The word "testament" appears to have been used by our Lord in the ordinary sense of "will" and "testament," indicating that in that funeral feast He was bequeathing Himself to His disciples for ever.<sup>1</sup> The insertion of "new," by a sort of play upon the double meaning of the word "testament," introduces the sense of "covenant," and therewith a contrast between the old and the new covenants. But this suggestive thought (highly characteristic of Paul) seems more likely to have been added to the original in process of explanation, than to have been dropped by Matthew and Mark through neglect, or discarded owing to difficulty. The probable solution therefore would seem to be that Luke has embodied, not the earliest tradition, but the later Pauline shape of the tradition. We have here therefore not Paul supporting the tradition of Luke, but Luke (in all probability) borrowing from Paul.<sup>2</sup> The only other passage in which Paul (in the Acts) quotes a saying of Jesus contains (Acts xx 35) words not found in any of our Gospels, "It is more blessed to give than to receive."

The Second Epistle of Peter (2 Pet i 17) contains a reference (apparently) to the transfiguration, of which the writer speaks as an eye-witness. But this testimony, most important if genuine, is almost certainly spurious. The mention of the mount of transfiguration as "the Holy Mount," and of Paul's epistles as "scriptures" would in itself suggest a late date, and Canon Westcott (*Gospels*, p 175) justly says that "the comparative elaborateness

of the description (of the transfiguration) seems to offer an instructive contrast to the simplicity of the earlier Gospel." External evidence is also against the genuineness of this epistle. Up to the times of Clement of Alexandria "no trace has been found of its existence" (Westcott, *Canon*, p 349), and neither Origen nor Eusebius accepts it as canonical. To obtain a complete idea of the judgment of the church upon the canon, we must combine (Westcott, *Canon*, p 264) the two canons of the East and West, by doing this "we obtain, with one exception, a perfect New Testament without the admixture of any foreign element." That "exception" is the Second Epistle of Peter. The only importance to be attached therefore to the testimony of an epistle thus rejected by the general consent of the early church is that which attaches itself to an early literary fabrication composed so early as to have found a place in our canon. Such a composition (mentioning Paul's letters as "scriptures") cannot have been written before the beginning of the second century, yet we find that, even at that date, the common tradition is quoted most inexactly. The voice from heaven, as given by the author of the spurious epistle, is, "Ὁ υἱὸς μου ὁ ἀγαπητός μου οὗτός ἐστιν εἰς ᾧ ἐγὼ εὐδόκησα." But in Matthew (xvii 5) it is οὗτός ἐστιν ὁ υἱὸς μου ὁ ἀγαπητός ἐν ᾧ εὐδόκησα. ἀκούετε αὐτοῦ εὐδόκησα. The inaccuracy is the more serious because, in describing the baptism of Jesus Matthew (iii 17) speaks of a voice from heaven which almost exactly agrees with the words in the Epistle, omitting the words ἀκούετε αὐτοῦ. In these circumstances it is impossible to say that the author of this spurious Epistle had Matthew before him. Much more probably he was quoting from memory, or from some document differing from any of our synoptic Gospels.

The next witness is Clement of Rome, whose Epistle to the Corinthians, probably written in or soon after 95 A.D. (Lightfoot's *Clement of Rome*, Appendix, p 267), contains three passages which may indicate a use of our Gospels. (1) In chap. xiii he blends together (Sunday, *The Gospels in the Second Century*, p 921) passages common to Matthew (v 7, vi 14, vii 12, vii 2), Mark (iv 24, xi 25), and Luke (vi 36, 37, 31, 38, 37) in a terse antithetical, and uniform style, inserting the words, ὡς χρηστεύσθε οὕτως χρηστεύθησεται ὑμῖν. Dr Lightfoot has pointed out that the looseness of this quotation does not exceed the looseness with which (chap. 12) the same author quotes the narrative of Rahab, and therefore it is quite possible that here, as there, Clement may be simply quoting from memory with no other documents than Matthew and Luke in his mind, but to many the "roundness, compactness, and balance of style" which Dr Sunday notices in the quotation will make it probable that Clement was quoting not perhaps from any other document (for else how is it that no trace remains of a documentary version of the word of the Lord so "rounded and compact" in style, and used 95 A.D. by so eminent a man as Clement of Rome in writing to the church of Corinth?), but with some tradition in his memory (which had perhaps served the purpose of preachers, teachers, and catechists in the Roman Church), blending and condensing the versions of Matthew and Luke into a form adapted for the oral instruction of converts. (2) In another passage (chap. xxvi) Clement combines Mat xviii 6 (Mk ix 42, Lu xvii 1, 2) and Matt xxvi 24 (Mk xiv 21, Lu xxii 22) in a manner which suggests quoting from memory. (3) A third passage (Sunday, p 70) contains a quotation from Isaiah (xxix 18) differing from the Hebrew and from the similar LXX. (which is, ἐγγίξει μοι ὁ λαὸς οὗτος ἐν τῷ στόματι αὐτοῦ καὶ ἐν τοῖς χεῖλεσιν αὐτῶν τιμῶσιν με, ἢ δε καρδιά αὐτῶν πόρρω ἀπεχεῖ ἀπ' ἐμοῦ), and substituting a condensed and antithetical form, οὗτος ὁ λαὸς τοῖς χεῖλεσιν με τιμᾷ, ἢ δε καρδιά αὐτῶν πόρρω ἀπεστίν ἀπ' ἐμοῦ, which is also found in Matt xv 8 and Mk vii 6 (except that they read ἀπεχεῖ for ἀπεστίν). The inference has been drawn that Clement is quoting from our Gospels. But this is not the only passage where quotations from the Old Testament in the New appear to have been influenced by an "ecclesiastical use," arising in some cases from a desire to make the application closer (compare Jo xix 37 with the LXX. version of Zech. xii 10, and note that this version is exactly quoted by Justin, and allusively by the author of the Apocalypse, i 7), or part from abridgment or other causes (compare Mat iii 3, Mk i 3, Lu iii 4 with Isa xl 3). Therefore, even though the citation in Clement exactly coincided with the citation in Mark and Matthew, it would not follow that Clement cited it from them, and as the quotation is not identical, the probability is that it is quoted by Clement, with a slight alteration, from memory of "ecclesiastical use." There is also in chap. ii ("more gladly giving than receiving") an allusion to the saying of Jesus mentioned in Acts xx 35. Our conclusion is—(a) that Clement of Rome, about 95 A.D., is proved to have a knowledge of the several scattered sentences in our common tradition which he quotes as "words of the Lord," but very loosely and freely, (b) that his quotation of the Old Testament appears on one occasion to be influenced by Christian "ecclesiastical use", (c) that he uses (but whether as a quotation or not we have no means of determining) some words not found in our Gospels, which words are attributed to Jesus by the author of the Acts of the Apostles.

<sup>1</sup> Similarly it is used in the Epistle to the Hebrews (ix 17), οἰαθῆκη γὰρ ἐπὶ νεκροῖς βεβαία ἐκεῖ μὴποτε ἰσχύει ὅτε ἡ οὐ διαβεβημένος. This use of the word is also found in the title of the early apocryphal work, *The Testaments of the Twelve Patriarchs*. It is said by Mr. Sinker, in his edition of that work (p. 82) that probably by the time of the composition of the *Testaments* (i.e., before 135 A.D.) "the word διαθῆκη itself [דִּבְרֵי] had been taken into Hebrew in the sense of 'will' (Buxtorf *Lex Rabbinica* sv). It would seem to follow that long before that date, the word διαθῆκη was in regular use in Hebrew Greek to render the meaning "will" or "testament" although of course it also represents (and very much more frequently, owing to the more frequent repetition of the thought in the New Testament) the meaning "covenant."

<sup>2</sup> If the similarity between Luke xxii 20 and 1 Cor xi 25 arises from an interpolation in the former in that case the negative conclusion remains the same that we have not here Paul supporting the tradition of Luke.

Early in the second century we for the first time meet with a quotation from the addition to the common tradition which are peculiar to Matthew. The Curetonian or shorter version of the epistles of Ignatius (107 or 115 A D) uses Matt x 16 almost *verbatim*, and possibly refers (Sunday, p 79) to the star of Matthew (chap 11). The Vossian or longer version of the Ignatian epistles which may be accepted as testimony for about 150 A D) contains, besides in ample and somewhat exaggerated reference to the star in Matt. 11, three or four (Westcott, *Canon*, p 60) short but striking phrases peculiar to Matthew. But none of these passages have marks of quotation the words of Matthew being in each case embedded in the writer's own words. It is remarkable that the only words of the Lord expressly quoted by Ignatius are words not found in any of our synoptic writers. "And when He came to those about (περὶ) Peter, He said to them, Take, handle Me, and see that I am not a bodiless demon." These words, although they have some likeness (the word *ψηλαφῆσατε* is in both) to Lu xxiv 39, are expressly said by Eusebius to be derived from some source unknown to him and by Jerome to be derived from a Gospel which he had translated (from Hebrew), and which was read in his time by the Nazarenes (Kuchhofe, p 449), and, according to Origen, the passage occurred in the teaching of Peter. It is, of course, impossible for us, upon this evidence, to determine whether Ignatius quoted from the Nazarene gospel, or from the teaching of Peter, or from some other document or tradition embodied before or after in both those documents. Our conclusion is that, by the middle of the second century, the writer of the Vossian version of the Ignatian epistles was familiar with the Gospel of Matthew, but that he also used other sources (not known to us) when quoting the words of the Lord in support of the material resurrection of Jesus.

Barnabas

In the Epistles of Barnabas (100-125 A D) is found (chap iv) the first apparent reference (if we except the reference in 2 Pet iii 16) to any passage of the New Testament as "written." Let us beware lest we be found, as it is written, many called, but few chosen, words almost exactly found in Matt xxii 14 alone (probably interpolated in Matt xx 16). There is also an allusive quotation of the words in Matt ix 13, Mk ii 17, Lu v 32. "I came not to call the righteous, but sinners." The only words expressly assigned to Jesus (chap vii) are not found in our Gospels. "Even so, saith He, they that would see Me and touch My kingdom, must take Me, through persecution and suffering." It is most unfortunate that the inexactness of the verifiable quotations in this epistle prevents us from laying much stress upon the author's statement as to the source of those which are unavailable. For example, in chap xxi, the author has, "The scripture saith, And it shall come to pass in the last days, that the Lord will deliver up the sheep of His pasture, and then sheepfold and tower to destruction. And it so happened as the Lord had spoken." But we know of no "scripture" containing these words, and the probability is that the author was quoting from memory and erroneously is when (chap v.) he combines Isa. iii 9 and Wisdom ii 12, is follows. "The prophet speaks against Israel, Woe to their soul because they have counselled an evil counsel against themselves, saying, Let us bind the Just One, because He is displeasing to us." Our conclusion is that, if Barnabas is deceived by his memory in attributing one passage to "writing" or "scripture," he may be deceived about another, and that we consequently cannot feel sure that he is quoting Matt. xxii 14 from a document and not from memory of oral tradition. But (a) that the author is acquainted with passages found in Matthew is certain, and (b) it is also certain and noteworthy that the only words of the Lord quoted by him are quoted from sources not known to us.

Polycarp

Polycarp (born about 69 A D, died 155 or 156) quotes (chap ii) sentences from the Sermon on the Mount similar to those quoted by Clement above, with the preface, "remembering those things which the Lord said (while) teaching, Judge not," &c. The quotation, like Clement's, is antithetical and compressed, but neither in order nor in words agrees so far with Clement's as to make it in the least degree probable that Polycarp and Clement are quoting from a written version differing from our synoptics. There is also a quotation from Mat xvi 41 and Mk xiv 38, and a reference to Mat xi 13, "Asking the all-beholding God not to lead us into temptation, even as the Lord said, The spirit indeed is willing, but the flesh is weak." Two other coincidences (chap v and vi) seem to refer to Mat x 28 Mat ix 35, Mat vi 12, 14, Lu xi 4. There are no supposed allusions to apocryphal writings in Polycarp (Westcott, *Canon*, p 61). It will be seen from what has been said above that there is nothing remarkable in the great variations with which the "Sermon on the Mount" was taught and quoted among the Christians in the first century. Like the "Lord's Prayer," it has not a literary but a practical interest, and being much used in many different churches from the earliest times, it may naturally have assumed many different shapes serviceable for catechists and preachers. This consideration (and the possibilities of variation arising from translation) may easily account for the variation between Clement and Polycarp, without necessitating or justifying, even as a working hypothesis, the supposition that

Clement or Polycarp, in quoting the "Sermon on the Mount," quoted from other documents than our existing Gospels.

The "Shepherd" of Hermas, written about 135-40 A D, "con- tains no distinct traces of any writing of Old or New Testament" Hermas (Sunday, *Gospels*). This is worth bearing in mind, as a warning that the nature of the subject will greatly affect the number of quotations from the scriptures in any early books. The allegorical nature of the "Shepherd," intended more as a stimulating tale than as a polemical or hortatory discourse, dispenses with scriptural illustrations, and in the same way Justin, in his *Second Apology*, refrains from quoting the scriptures, while in his other works he multiplies quotations or references. In appealing to the heathen, Justin "quotes the scriptures only when he must speak of things beyond the range of common history, preferring elsewhere to appeal to external documents such as the enrolment of Quirinus and the Acts of Pilate" (Westcott, *Canon*, p 110).

Papias, who wrote about 130-140 A D, composed five books, Papias entitled "Exposition (ἐξηγήσεις) of the Oracles of the Lord." It is (apparently) in an introduction to this work that he speaks (Euseb, iii 39) of traditions gathered from different sources. "But I will not shrink from placing along with my interpretations (ἐρμηνείας) as many (traditions) as at any time I learned well, and well stored up in memory from the elders." The noun "interpretations" (ἐρμηνείας) may receive some light from Papias's own use of the words ἐρμηνευτής and ἐρμηνεία, as quoted in the same chapter of Eusebius. "Mark," he says, "was the interpreter of Peter (ἐρμηνευτής Πέτρου γενόμενος)" again, "Matthew wrote his scriptures (λογία) in Hebrew, and each man interpreted them (ἑρμηνεύσε) as he best could." So Eusebius himself in the preceding chapter tells us that some believe Clement to have "interpreted" (ἐρμηνεύσαι) Paul's (Hebrew) Epistle to the Hebrews into Greek. Our conclusion would be that the word ἐρμηνεία may here mean something more than mere "commentary," it may imply that he, as others had done, wrote an interpretation of the "Logia," accompanied by comments and by supplementary traditions. At all events he does not speak of any one Greek "interpretation" of Matthew as being as yet paramount and authoritative, so as to exclude the necessity of further "interpretations." Of Mark he speaks (in the person of "the elder") almost apologetically, implying that his narrative had been censured for its incompleteness and unpolished style, and he defends it by quoting a tradition from "the elder" (apparently, John the elder) thus — "Mark, having become Peter's interpreter wrote down accurately all that he remembered—not, however, in order—both the words and deeds of Christ. For he neither heard the Lord, nor attached himself to Him, but later on, as I said, attached himself to Peter, who used to adapt his lessons to the needs of the occasion, but not as though he were composing a connected treatise of the discourses (λόγων, ἢ τῶν λογίων) of the Lord: so that Mark committed no error in writing down some matters just as he remembered them (ἀπεμνημόνευσε). For one object was in his thoughts (ἐνδὲς γὰρ ἐποίησεν πρόνοιαν)—to make no omissions and no false statements in what he heard."

Much of this exactly applies to our Mark. If we desire to know what is meant by Mark's not writing "in order," we have only to turn to Luke, who made it his object to write "in order," and whose arrangement, chronologically as well as artistically, differs from Mark. It is true that we may be disposed to think Mark's "order" not inferior to Luke's, but the fact is indisputable that Luke attempted to write "in order," and that his "order" differs considerably from that of Mark, who manifests no purpose except the desire to put down what he knew as he remembered it. It has been shown above (see p. 802) that Mark's Gospel is rather a collection of anecdotes than a connected narrative, and of such a collection it would be natural to say that it was not written as an orderly narrative. To the single evidence of Papias, derived from an unknown elder, not much importance can be attached, and it is very doubtful whether the most searching investigations will ever determine with certainty the name of the author or authors of any one of the synoptic Gospels. But at all events, it is only reasonable to admit that the hypothesis of "notes" taken from oral discourses, and serving as the groundwork for the Second Gospel, would explain many of its phenomena. If these oral discourses embodied the early common Greek tradition, it would be easy to see how the First and Third Gospels came to resemble the Second Gospel, although all three Gospels are mutually independent. As regards the First Gospel, it has been shown above that internal evidence is against the theory of a very early authorship, and we

<sup>1</sup> No one word in English will exactly express the word *λόγια* which was used both before and after Papias, to mean not merely "sayings" but "Scriptures"—Lightfoot *Contemporary Review*, Oct 1875.

— Cf also Clem. Alex. *Strom.* vii 17 106, where certain heretics appeal to Glaucias τῶν Πέτρου ἐρμηνεία, and Jerome suggests as an explanation of the difference in style between the First and Second Epistle of Peter that the apostle used different interpreters (Kuchhofe, p 276). The point for consideration is not whether the statements of Papias are correct, but what Papias meant when he spoke of Mark as ἐρμηνευτής and of himself as writing ἐρμηνεία.

must add that it exhibits no signs that the portion before the call of Matthew was written from hearsay and that after the call of Matthew by an eye-witness. But there seems the following strong argument in favour of the tradition of Papias as to the authorship of Matthew if there was no basis for it, if it was a mere fiction or guess, why not select, as the author, some more distinguished apostle, Peter, John, or James? This argument is neutralized by the following consideration. The apostles (Acts iv 13) were known in the earliest days to have been unlearned and ignorant men, and although the Holy Spirit gave them power to speak and teach, it was less natural that they should be inspired with power to write and to compose connected treatises. But Matthew being a publican, and necessarily ready with his pen, might naturally be supposed in the post-apostolic generation to be a skilful writer; so that if an early tradition with general apostolic authority was committed to writing, the church would naturally select Matthew the publican and ready writer as the special author of it. Nevertheless, the testimony of Papias is important as attesting the belief (1) in a Hebrew origin for the Logia or the Gospel scriptures, and (2) in an early multiplicity of "interpretations."

The apologetic tone in which Papias introduces the traditions, which he "will not shrink from placing along with the interpretations" of the scriptures, indicates that the written scriptures were gradually subordinating tradition. He nowhere expresses an opinion that the Logia are unauthoritative, but he implies that they require "interpretation," and adds (almost as though it were an idiosyncrasy) that he set a great store on supplementary tradition from the sources nearest to the truth,—not only taking pleasure in those who taught the commandments that came from the Lord (who was) the very truth (i.e., the disciples of the Lord), but also questioning any who had "attached themselves to the elders," whom he used to examine closely on the utterances of Andrew, Peter, Philip, Thomas, James, John, Matthew, or any other of the disciples of the Lord, and on the sayings of Ariston and the elder John, the disciples of the Lord.<sup>1</sup>

<sup>1</sup> Eus., *H. E.* iii 39. Οὐκ οὐκῶσα δὲ σοὶ καὶ οὐα ποτὲ πᾶρα τῶν πρεσβυτέρων καλῶς ἐμαθὼν καὶ καλῶς ἐμνημονεύουσα, συναρτᾶσαι ταῖς ἐρημνείαις, διαβεβαιούμενος περὶ αὐτῶν ἀληθεῖαν οὐ γὰρ τοῖς τα πολλὰ λεγούσιν ἐχαίρων, ὡσπερ οἱ πολλοὶ, ἀλλὰ τοῖς ταλὴρῇ διδάσκουσιν, οὐδὲ τοῖς τὰς ἀλλοτριὰς ἐντολὰς μνημονεύουσιν, ἀλλὰ τοῖς τὰς παρὰ τοῦ κυρίου τῇ πίστει δεδομένοις καὶ ἀπ' αὐτῆς παραγιγνομένοις τῆς ἀληθείας· εἰ δὲ πού τις καὶ παρηκολούθηκός τις τοῖς πρεσβυτέροις ἐλθὼν, τοὺς τῶν πρεσβυτέρων ἀνεκρίνων λόγους· τί Ἀνδρέας ἢ τί Πέτρος εἶπεν ἢ τί Φίλιππος ἢ τί Θωμᾶς ἢ Ἰάκωβος ἢ τί Ἰωάννης ἢ Ματθαῖος ἢ τις ἐταρὸς τῶν τοῦ κυρίου μαθητῶν, ἃ τε Ἀριστίων καὶ ὁ πρεσβυτὴρ Ἰωάννης οἱ τοῦ κυρίου μαθηταὶ λεγόντι. It is maintained by able scholars (from whom dissent can be expressed only with great diffidence) that the λεγόντι indicates that Ariston and John the elder were living while the εἶπεν indicates that Andrew, Peter, John the apostle, Matthew, and all the rest of the apostles were dead at the time "when Papias began his investigations" (Westcott, *Canon*, p. 69). Now John the apostle is supposed to have died at a very advanced age, about 98 A.D. and Papias (*Lightfoot Contemporary Review*, May 1876) to have been born about 60-70 A.D. and to have written (*Westcott ut sup.*) about 140-150 A.D. We have therefore to suppose on this hypothesis (a) that Papias did not "begin his investigations" till he was twenty-eight or thirty-eight years old (i.e., not till seven or seventeen years after he had attained to manhood), although the apostle John was living all that time in his immediate neighbourhood, (b) that two personal disciples of Jesus outlived the aged apostle John for a period long enough to enable Papias to conduct a systematic investigation into their traditions during their lifetime. "Improbable" is too mild a word for such a hypothesis. It seems very much more probable that λεγόντι is simply the graphic present used for variety. Papias desires to make a distinction between the dicta of the apostles and the less authoritative utterances of Ariston and John the elder, who were not apostles. For this purpose he not only (1) mentions them separately but also (2) varies the construction, changing τί into ἃ τε, and (3) εἶπε into λέγει. A hundred instances might be given from the Gospel of St. John alone, where εἶπε and λέγει are used indifferently and alternately for the mere purpose of variety, see John iv 9, 10, 11, 13, 15, 17 (ὅτι), and the whole of the gospel *passim*. And for the use of λέγει in a dependent sentence following an imperf. indic., compare Plato, *Apol.* 21 B, ἡρότων τι ποτὲ λέγει, "I was in doubt as to what (the oracle) meant." It is true that Eusebius, though he denies Irenæus's assertion that Papias was a hearer of John the apostle, maintained that Papias heard John the elder. But he appears to have no evidence for this statement except the sentence just quoted, and the fact that Papias set down certain traditions of John the elder mentioning him by name. His words are: Ἀριστίωνος δὲ καὶ τοῦ πρεσβυτέρου Ἰωάννου αὐτῆσιν ἐαυτῶν φησὶ γενέσθαι. Ὀνομαστὶ γούν πολλὰς αὐτῶν μνημονεύσας ἐν τοῖς αὐτοῦ συγγράμμασι τήσιν αὐτῶν παραδόσεις. This is quite insufficient in face of the great difficulties in such a supposition. The only tradition of an elder quoted by Eusebius from Papias with any words of preface begins thus: "The elder said this also." Such a preface is quite consistent with the supposition that Papias had heard the tradition, not from the elder himself but from one who had attached himself to the elder (παρηκολούθηκός τῷ πρεσβυτέρῳ), and the above-quoted sentence of Papias itself better suits such a supposition, for the "cross-examining of those who had attached themselves to the elders" naturally applies to all the names that follow, and more especially to John, since he is expressly included in the class of "elders." "I used to cross-examine any that came in my way who had attached themselves to the elders (asking them), what said Andrew, and about the sayings of Ariston and John the elder, surely the natural inference is that Ariston and

It must be added that Papias, besides recording the raising of a dead man by Philip, and the drinking of poison without injury by Justus surnamed Barsabas, is said by Eusebius to have narrated several "strange parables and teachings of the Saviour," and other fabulous matters, originating from a literal understanding of figurative expressions. He also published "a story about a woman accused in the presence of the Lord for many sins, which is contained in the Gospel according to the Hebrews" (Euseb., *ib.*) It has been demonstrated by Dr. Lightfoot that Eusebius, in treating of the disputed and undisputed writings of the earliest times, adopted one course for the former and another for the latter. (1) As to the disputed books, the *antilegomena*, he pledged himself to "record when any ancient writer employs any book belonging to their class," but (2) as regards the undisputed canonical books, he only professes to mention them, "when such a writer has something to tell about them" (τίνα περὶ τῶν ἐνδιασθέντων εἰρηται) *Contemporary Review*, Jan. 1875. We are not therefore to infer from the silence of Eusebius that Papias did not know or quote the Gospels of Luke and John, but only that he said nothing about them, which of course might arise from either of two causes, either because he did not know of their existence, or because, knowing their existence, he "had nothing to say about them." What bearing this may have on the authorship of the Fourth Gospel we shall see hereafter. But, so far, we see written scriptures still (1) supplanted by oral tradition, (2) freely criticized as inadequate, and (3) accompanied by memoirs of various interpretations from some Hebrew original, though rapidly emerging, if they have not already emerged, to authoritative definiteness.

One fact is of the highest importance. We have seen that Papias was of a curious disposition, discontented with the written records before him, and anxious to supplement them by traditions. He was also, according to Eusebius, a man of no great judgment, fond of recording wonders, and, by his own account, fond of recording novelties. If therefore there had been any other non-canonical Gospel at that time, rivaling our present Gospels, and known to Papias, it seems probable, if not certain, that he would have used such a book, and, if he had done so, Eusebius could not (in the execution of his plan) have failed to mention such a use, but Eusebius makes no mention of the use of any non-canonical gospel by Papias. Even in the narrative of the sinful woman mentioned above, which was found in the Gospel according to the Hebrews, Eusebius expressly avoids saying that he derived the narrative from that Gospel. He merely says that Papias "has published a narrative which is contained in the Gospel according to the Hebrews" (it is probably the narrative interpolated in Jo viii 1-11), whereas, almost in the same sentence, he says that Papias "has used testimonies from the First Epistle of John." This negative evidence from the silence of Papias is strongly in favour of our Gospels.

In the works of Justin Martyr (who is supposed to have written Justin's *Apologies* and *Dialogue with Trypho*, 145-147 A.D., so Hort, *Martyr*, quoted by Westcott, *Canon*, p. 98) we find definite and abundant mention of written documents containing the facts of the Gospel narratives, but no assigned names of authors. The Gospel is by him considered as a whole, sometimes called *εὐαγγέλιον*, sometimes *εὐαγγέλιον*, but frequently τὰ ἀπομνημονεύματα τῶν ἀποστόλων, and once (when he is referring to Mark's Gospel) τὰ ἀπομνημονεύματα Πέτρου. Bearing in mind Xenophon's well-known ἀπομνημονεύματα Σωκράτους, from which title "the word had already been borrowed by several writers" (Westcott, *Canon*, 108), we might naturally infer that the memoirs were not written by the apostles, but about the apostles or rather about their teaching, and this view is confirmed by what Papias says (above) about Mark, that he ἀπεμνημόνευσε, "recorded from memory," the teaching of Peter.<sup>2</sup> This probably was originally the meaning of the title as applied to our Gospels; but it seems to have been understood differently by Justin, as though it meant "written by the apostles." For in describing the descent of the Holy Spirit on Jesus at His baptism he uses the words, "The apostles wrote." It might indeed be said that he has in his mind Matthew and John, for John also records

John are included in the "elders." If this be so, every difficulty vanishes. Papias, though placed before Polycarp by Eusebius, may have been naturally so placed because he died before the aged Polycarp so that his work fell in a period preceding Polycarp, but he may have been born about the same time or later, say 80 A.D. In that case the last of the apostles would have passed away before Papias was nineteen, and when Papias began his investigations he would necessarily have to rely on the pupils of the elders, since the elders themselves, whether apostles, as Andrew and Peter, or mere elders, as Ariston and John, had all passed away. If, however, it should appear after all that Papias did hear John the elder, it follows that when Irenæus described Papias as "the hearer of John," he either (1) meant John the elder, or (2) confused John the elder with John the apostle. In either case most important consequences might follow, bearing upon the authorship of the Fourth Gospel. For it follows that, if here, then on other occasions, when speaking of the authorship of the Fourth Gospel, Irenæus either (1) may have meant John the elder where we at present suppose him to mean John the apostle, or (2) may have confused John the elder with John the apostle.

<sup>2</sup> Clement of Alexandria (*Eus., H. E.*, vi 14) expressly says that Peter had no part in the composition, and did not even encourage it. There seems to have been an early and not unnatural tendency to depreciate the Second Gospel

this, but St John's Gospel is not once quoted in the whole of his works, and it is inconceivable that, in this latent fashion, he should have referred once to a writing as apostolic which elsewhere he never quotes. It seems more likely that Justin considered that the *ἀπομνημονεύματα Πέτρου* were written by Peter, so that the first two Gospels at all events were written by apostles, or else that he considered the First Gospel not to have been written by one apostle, but to have been a joint apostolic production. Elsewhere, in describing the agony of the Lord (Lu xxii 44), a passage peculiar to Luke, he seems to have been struck with the inapplicability of his favourite title to a work written by one who was only a follower of the apostles, and instead of his usual formula he here substitutes "the memoirs which I assert to have been written by the apostles, and by those who attached themselves to them," but even this more precise description would only hold good of the three Gospels used by Justin, on the supposition that the "Memoirs of Peter" were written not by Mark but by Peter. The subject is important as showing by what easy stages a work written by a pupil might be supposed (even in the face of direct evidence to the contrary) to be written by the teacher.

For a full discussion of Justin's quotations from the Gospels the reader is referred to Westcott *On the Canon of the New Testament*, pp 95-175 and Sanday, *The Gospels in the Second Century*, pp 88-137. Here it must suffice to state a few general conclusions deduced from an examination of his use of the Old and New Testament.

We must bear in mind then (1) that Justin is writing polemically and that (especially in his dialogue with the Jew Trypho) a main object with him is to show that "the prophets are fulfilled in Jesus," to the proof from prophecy he attaches more importance than to any other. (2) He is a most inexact quoter and though he quotes long passages from the Old Testament accurately, shorter passages are quoted from memory inexactly, while Messianic passages, even when long, are modified (sometimes with a closer return to the Hebrew original) by Christian use and adaptation to Christ. (3) He often inserts words and notions of his own in the passages quoted from the Old Testament for example, he says that Moses, in order to heal the children of Israel from the plague of serpents "took brass and made an image of a cross and set this in the holy tabernacle, and said to the people 'Should you look on this image and believe on it, ye shall be saved' (*Canon*, p 124). (4) He ascribes texts to wrong authors, and quotes the same text in various shapes, not only in different books, but even in the same book and at short intervals (*ib* 127). This being the case, we shall naturally be prepared, in approaching the New Testament quotations of Justin, to find many inaccuracies, and some alterations of fact, especially where a slight alteration can render some Old Testament prophecy more applicable to the New Testament narrative.

Reviewing the quotations from the apostolic fathers given above we shall expect to find in Justin also a great number of the words of the Lord and incidents in the life of Jesus quoted from tradition, which are not found in our Gospels. Clement, we find, has two passages roughly quoted from our Gospels and one traditional saying quoted in Acts x. 35. Ignatius (Vossian) uses phrases or sentences from Matthew four times allusively, but quotes a "word of the Lord" found in no Gospel. The author of the Epistle of Barnabas quotes Matthew once and a non-canonical word of the Lord once. Polycarp is the first apostolic father who while four or five times quoting or alluding to sayings in our Gospels, quotes no non-canonical passages. Papias "published" a narrative contained in the Gospel according to the Hebrews. If then, in the small modicum of quotation hitherto given, so large a proportion (say a fourth) is non-canonical, how much more non-canonical matter might we naturally expect to find in Justin, who in two works quotes our Gospels 67 times (Sanday, p 116), and occasionally in long continuous passages? We shall also expect to find in Justin many misquotations of our Gospels, arising from interpolations and corruptions of the text, for "the worst corruptions to which the New Testament has ever been subjected originated within a hundred years after it was composed" (Scrivener, quoted by Sanday, p 135). A generation after Justin, Irenæus will be found quoting the interpolated appendix of Mark, which the general consent of scholars now recognizes to be spurious, and it has been pointed out that the differences of Justin from the ordinary text are little more than the differences of Codex D from the same text.

Bearing these considerations in mind, we ought to be surprised, not at the large, but at the small amount of extraneous matter which Justin has introduced into the Gospel narrative, and at the comparative accuracy with which he has quoted the Gospels. Treating of the variations of quotation, Dr Westcott has shown that, even where Justin's misquotations are found in other authors, the resemblances are of such a kind as to be easily derivable from some common tradition, or from some early but now obsolete text (*Canon*, pp 148-156). The extraneous matter may readily be explained as arising either from sense of an omission or from the

morbid desire to find in each incident of the life of Christ the fulfilment of some prophecy in the Old Testament. If for example (1) he speaks of the voice from heaven at the baptism as being "I thou art My Son this day have I begotten Thee" this is explained (apart from the various reading in D, which no doubt arose from the same motive) by a desire to see in the voice a repetition of Ps ii 7. (2) If a fire is said to have been kindled in the Jordan at the Lord's baptism, was it not natural that He who came to baptize others with the higher baptism of fire as well as that of water, should Himself receive the highest baptism, or that the act which was already technically known as *φωτισμος*, "enlightenment" should be accompanied (in the case of the Lord of Light) by that symbol which was specially characteristic of the divine presence? (3) If Mark recorded that Jesus was a "carpenter" (a fact not then suppressed by the various reading in Mk vi 3, owing to such sneers as those of Celsus Origen, *Cont Cels*, v 34) was it not fitting that the Carpenter, who bade men lay hand on the plough, and take His yoke on them, should have wrought when among men, ploughs and yokes? (4) If he speaks of the Magi as having come "from Arabia," had it not been prophesied Ps lxxi (lxxii) 10, that the kings of the Arabians shall bring gifts? (5) If the foal of the ass on which our Lord entered Jerusalem was said by Justin to have been "bound to a vine," must it not needs have been so, seeing that it was said of Judah (Gen xlii 11) that "he bound his foal unto the vine"? (6) Lastly, since Isaiah predicted (xxxiii 16 in LXX) that "he shall dwell in a high cave of a strong rock, was it not necessary that the Messiah should not only be born in Bethlehem but also "in a cave"?

In all these additions there is absolutely nothing to make probable, or even suggest (even though the "fire" at the baptism of Jesus is mentioned in an apocryphal Gospel) that Justin used any other written Gospel than those known to us. These thoughts and others like them were floating in the atmosphere of every Christian church in those days. They were the results naturally developed from that habit of appeal to prophecy which has produced, even in our own canonical Gospels, not inconsiderable effects, and there is nothing in Justin's additions that is not capable of being explained from the same method (developed a little further) as that by which we may explain Matthew's addition about the potter's field and possibly some of the other passages peculiar to the First and Third Gospels. Nor does the omission of the names Matthew, Mark, and Luke, by Justin, throw any doubt upon the supposition that he used the Gospels called by those names. It is quite possible that the names were given to these Gospels long after their composition. The very title "The Gospel according to Matthew," &c (not *of*, or *by*, Matthew), indicates that, even at the time when the titles were assigned, the compilers were regarded rather as editors of an old and received tradition than as authors of a new book. It is therefore quite possible that Justin (who mentions John by name as the author of the Apocalypse) may have used the first three Gospels, and yet have been ignorant of the names under which they are now current.

Three most important facts remain to be mentioned. (a) Justin tells us that in his days the memoirs of the apostles were read with the books of the prophets in the service of the church. This public reading of the memoirs must have given, if not a complete security, at least a considerable guarantee, against material alterations. The fact that the new traditions were now placed on a level with the ancient and venerable writings or scriptures of the Old Testament was a still more effectual barrier against change. (b) Although Justin mentions sayings of our Lord and events in His life not found in our Gospels, yet "he never does so when he proposes to quote the apostolic memoirs" (Westcott, *Canon* p 157). (c) In describing the fire kindled in the Jordan and the voice from heaven, he not only does not quote the memoirs, but, by implication, distinguishes these statements from other statements immediately following, which are quoted from the memoirs (*Canon* pp 158-159).<sup>1</sup>

To conclude, we find that, although Justin knew and used traditions, yet (1) he set a special value on certain writings, which were publicly read in the churches, (2) he believed these to have been written by apostles or the immediate disciples of apostles, and he repeatedly quotes them under this title. (3) though he does not lay stress on miracles (for miracles would be assumed by the Jew Trypho, accustomed to the miracles of Moses and Elisha, and they would be rather harmful than helpful to his cause in the eyes of educated Greeks and Romans), nor on the longer lessons involved in Christ's parables, yet he covers the greater part of our Gospel history, and much of our Lord's teaching through maxims, this he does to such an extent that it is possible (Sanday, pp 91-98) to reconstruct from his quotations a fairly connected narrative of the incarnation, birth, teaching, crucifixion, resurrection, and ascension of the Lord, (4) the whole of this narrative (with the exception of the few unimportant incidents mentioned above, and one or two

<sup>1</sup> Perhaps we may also lay some stress on the fact that, in the seven passages in which Justin uses the phrase, it is written as applied to the memoirs he almost always agrees *verbatim* with Matthew or with Luke (*Canon* p 130).

traditional sayings of Jesus) is found in Matthew, or Mark, or Luke, or in all three; and there is also a reference to an incident recorded by Mark alone; (5) he never, as from these memoirs, quotes any words, or alleges any incidents not found in our Matthew, Mark, or Luke; (6) he never quotes any rival Gospel, nor alleges any words or facts which make it probable he used a rival Gospel; (7) such non-canonical sayings and facts as he mentions are readily explicable as the results of lapse of memory, general looseness and inaccuracy, extending to the use of the Old as well as the New Testament, and the desire to adapt the facts of the new scriptures to the prophecies of the old. Our conclusion is that the memoirs of the apostles which include so much that is contained in our first three Gospels, and which were continuously read in the services of the church from the time of Justin downwards, cannot have passed into oblivion a few years afterwards, so as to have given place to rival Gospels not known to Justin. They must be identical with the Gospels, to some or all of which testimony is successively borne by Marcion (140 A.D.) in spite of his arbitrary and entirely uncritical excisions; by the heretical Clementine Homilies (160 A.D.) in spite of occasional use of apocryphal sources; by the Muratorian fragment (170 A.D.); by Athenagoras and Ptolemæus, and the churches of Vienne and Lyons (177 A.D.); till the century closes with the affirmation of Irenæus, who not only uses three synoptical Gospels with the Fourth so fully as to leave no doubt of the identity of his Gospels with ours, but also is so convinced of the essential necessity that there should be four and only four Gospels, that he discerns in the quadriform nature of the cherubim a type of the pre-ordained quadriform nature of the records of the life of Christ.<sup>1</sup>

Summary  
of the  
external  
evidence.

In the foregoing remarks attention has been mainly directed to definite evidence, whether external or internal. Limits of space, as well as other considerations, prevent the discussion of that more indefinite evidence which might perhaps be called indirect external evidence, and which would treat of the influences amid which the Gospels grew up and by which they were likely to be moulded. For such a discussion it would be necessary that we should place ourselves in the position of a disciple in some early congregation of Jewish or Gentile Christians, and endeavour to realize the influence exerted upon the Christian records—(1) by prophecy; (2) by heathen religions; (3) by Eastern metaphor acting upon Western literalism; (4)

by the ritual and language of the Lord's Supper; (5) by the universal predilection for the marvellous; (6) by the fall of Jerusalem. The results thus obtained would be in a great measure conjectural; but, compared step by step with the results deduced above, they would enable the reader to feel additional confidence in conclusions supported by the double confirmation of indirect as well as direct evidence. The best work in English bearing on this subject is probably the translation of Keim's *Jesus of Nazara* (London, 1876-79); and there is also much valuable information in the Appendices to Canon Farrar's *Life of Christ*.

## THE FOURTH GOSPEL.

### Authorship.

*Evidence from earliest Tradition.*—Before considering the subject matter of this Gospel, it will be well to consider the evidence, direct and indirect, bearing on the authorship. The author is not mentioned in the Gospel by name, but only as "the disciple whom Jesus loved" (xxi. 24, 20), "which also leaned on His breast," and to whom Jesus commended His mother from the cross (xix. 26; xiii. 23). The first writer who mentions John as the author in connexion with a passage quoted from our Fourth Gospel is said to be Theophilus, who wrote towards the close of the second century (170-180 A.D.). The Muratorian fragment (170 A.D.) speaks of the apostle as the author of a Gospel, but does not quote from it. But Theophilus quotes Jo. i. 1, as written by John, one of those "inspired by the Spirit" (πνευματοφόρων).<sup>2</sup> It is a natural inference that Theophilus (at so late a date), using the name thus without further definition, meant by "John," the "John" best known to his readers, i.e., John, the son of Zebedee, the apostle. But there is unusually strong evidence to show that John the apostle wrote the Apocalypse, so strong that we may assume the apostolic authorship of that book with more confidence than the authorship of any other book in the New Testament, except some of Paul's epistles. The question therefore arises, how far does the style of the Gospel, which was said by Theophilus (170-180 A.D.) to have been written by John (presumably the apostle), agree with the style of the Apocalypse, which we have so good reason for believing to have been written by the apostle John? If we assume John to have been four or five years younger than his Master, he would be, according to the commonly received date (68 A.D.) of the Apocalypse, about sixty-seven or sixty-eight years of age when he wrote that work. By that age (one would suppose) an author's style would, if ever, have reached its maturity. Even if he were ten years younger than Jesus, so that he was only a little over sixty years of age, yet his style would not be capable of a complete transformation. But when the Gospel is compared with the Apocalypse, instead of similarity, we find an almost complete contrast.<sup>3</sup> The vocabulary, the forms, the idioms, the rhythm, the thought—all is different. That the Apocalypse and the

The Gospel  
of the  
Hebrews.

<sup>1</sup> As a good deal of stress has been laid upon the apocryphal Gospel of the Hebrews, from which (according to the testimony of Jerome, Kirchhofer, p. 448) Ignatius quoted, it may be well to show that this was later than our Gospels. (1) We have seen above (p. 807) that in the common tradition Ἰησοῦς is habitually employed, and that the use of ὁ Κύριος, "the Lord," in narrative is a sure sign of later origin, but "the Lord" is habitually used in the narrative of the Gospel of the Hebrews (see Kirchhofer, pp. 450, 453, 454). (2) It softens moral difficulties. (a) in the story of the rich young man, the Lord says to him, "Behold, many of the brethren, sons of Abraham, are covered with dung and dying for hunger, and thy house, so full with many good things, and naught goeth forth at all from thee to them," thereby blunting the point of the young man's rejection; (b) after the words "If thy brother shall sin against thee" (cf. Matt. xviii. 22), Jesus adds, in the Gospel of the Hebrews, "in word, and if he shall make thee amends" (Jo. p. 454) (*in verbo et satis tibi fecerit*); (c) the error in Matt. xxiii. 35, "son of Barachiah," is corrected into "filium Jojadam," Jerome (Jo. p. 455). (3) It increases the marvellous element: (a) at the baptism of Jesus, "It came to pass when the Lord was come up from the water, the whole fountain of the Holy Spirit came down and rested upon Him, and said to Him, O My Son, in all the prophets I was awaiting Thee, that Thou mightest come, and that I might find rest in Thee; for Thou art My rest, Thou art My first-born Son, who reignest for ever" (Jo. p. 454); (b) hence the Holy Spirit is called the Mother of the Lord, and it is said by the Lord, "But now My Mother, the Holy Spirit, took Me by one of My hairs, and carried Me away to the Mount Tabor" (Jo. p. 451); (c) after His resurrection, it is added that the Lord ordered a table and bread to be brought, and caused His brother James to break his fast, when James had sworn not to eat bread till he had seen the Lord; in this story James is called "James the Just," a title which in itself is a mark of late composition.

To this note we may add that Celsus, towards the end of the second century, speaks of "the writings of the disciples of Jesus" (Jo. p. 320) as the source of his information, and mentions nothing (so far as we know) of any importance that is not found in our Gospels. It is true that Origen (*Cont. Cels.*, i. 74), in answer to Celsus's boast that he had crushed the Christians with facts taken from their own writings, replies, "But we showed (above) that there has been a great deal of nonsensical blundering, contrary (*παρά*) to the writings of our Gospels," &c.; but if we refer to what has gone before, we find that Origen is referring (1) to Celsus's unfair inaccuracy, e.g., in saying that Jesus was betrayed, not by one disciple, but by His disciples; (2) to such blunders as the confusion of "Chaldeans" with "Magi"; (3) to his ignorance of the number of the disciples, &c. There is therefore every reason to believe—for if Celsus had attacked any apocryphal narratives as representing the faith of Christ, Origen could not have failed to take advantage of the triumphant rejoinder which such a mistake would have afforded him—that an assaulter of Christianity, writing before the end of the second century, knew of no writings of the disciples of Christ upon which he could base any effective attacks against their religion, except our four Gospels.

<sup>2</sup> Such at least is the statement of Kirchhofer (p. 153), and it has been reproduced in modern books. But part of the period of Irenæus might precede part of the period of Theophilus; and Irenæus quotes John's Gospel (xx. 31) as from "John the disciple of the Lord," in a passage of his work *Against Heresies* (III. xvi. 5, or ed. Grabe, iii. 18), a passage omitted by Kirchhofer.

<sup>3</sup> It is not necessary, however, to deny that the Gospel exhibits traces of the Apocalyptic doctrine and thought. On the contrary, the impression left by a comparison of the two is, that the Gospel exhibits an attempt to refine and spiritualize some of the more material and concrete expressions of the Apocalypse. From this point of view, we may say that "the Gospel is the spiritual interpretation of the Apocalypse. . . . The active and manifold religious thought of Ephesus furnished the intellectual assistance which was needed to exhibit Christianity as the absolute and historical religion in contrast with Judaism and heathenism" (Westcott, *Introd. to St John*).

Fourth Gospel should have been written by the same author would be, we will not say impossible, but one of the most marvellous literary phenomena ever authenticated. The change in Shakespeare's style, or in the style of Burke, cannot be compared with this; for those changes can be in part explained by the transition from youth to maturity or old age. Here we have to explain how a writer could completely change language, style, and thought, after the age of sixty or sixty-seven years. It is possible, but *a priori* highly improbable.

It has indeed been suggested that this change of language may be explained by the lapse of more than thirty years, during which the author was living in the midst of a Gentile population. This assumes that the Apocalypse was written in 68 A.D., before John had resided in Ephesus, and that he wrote the Gospel at the age of ninety-eight. But (1) the minute knowledge of the Seven Churches (Rev. i. ii. iii.) makes it probable that the writer had resided for some time in their neighbourhood; (2) the composition of such a work as the Fourth Gospel at the age of ninety-eight is in itself unlikely; (3) it is by no means certain that the Apocalypse was written in 68 A.D., and not rather in 78 A.D., simultaneously with the fourth Sibylline Book (and the later the date of the Apocalypse the shorter the interval between it and the Fourth Gospel, and the more improbable becomes the theory of the change of style). An hypothesis based upon three hypotheses, themselves not proved or improbable, requires much evidence before it can be accepted.

There is yet another difficulty in the way of believing that John the apostle is the author: the words of Jesus in the Fourth Gospel (1) differ altogether in style and rhythm from the synoptic tradition of the words of the Lord, and (2) do not differ at all from the author's own remarks and observations. So great is the similarity between the words of the writer and the words which are assigned by him either to our Lord or to John the Baptist that Dr Westcott, commenting on Jo. iii. 10-21, 27-36, says (*Introduction to the Gospels*, p. 292), "It is impossible not to feel that the evangelist is in fact commenting on and explaining the testimony which he records. The comments *seem to begin* respectively at verses 16 and 31." The words italicized (not by Dr Westcott) require little comment. It is obvious that a biographer, who so mixes the words of his characters with observations of his own that a most careful and scholarlike commentator is unable to feel sure where the words of the characters end and the observations of the author "seem to begin," cannot be supposed to be exactly recording, scarcely even to be attempting to record with exactness, the words of the characters themselves. Yet it seems impossible that the "disciple whom Jesus loved" should either remember his Master's words so ill, or else deliberately transmute them into entirely different language of his own. A work of this kind, notwithstanding the presence of historical elements, seems rather to deserve to be called a poem, or a drama, than a biography; and accordingly the same careful commentator who is quoted above declares that "the spirit of parallelism, the instinctive perception of symmetry in thought and expression, which is the essential and informing spirit of Hebrew poetry, runs through the whole record" (*Introd. to the Gospel of St John*). Such a work does not seem likely to have proceeded from one of the sons of Zebedee, a fisherman of the lake district of Galilee, not indeed a poor man, but still not a man of letters nor of any great literary culture.

"The earliest account of the origins of the Gospel is already legendary" (Westcott, *Introduction to the Gospels*, p. 255), as given in the fragment of Muratori (A.D. 170). It is there said that, being requested by his fellow-disciples and bishops to write, John desired them to fast for three

days, and then to relate to one another what revelation each had received either for or against the project. The same night it was revealed to Andrew, one of the apostles, that "while all called (the past) to mind (or while all revised,—'cunctis recognoscentibus'), John should write everything in his own name." Legendary though this account may be, it curiously agrees with a passage in the Gospel itself which implies that others besides the author were "revising," or otherwise assisting in, the work: "This is the disciple which testifieth of these things and wrote these things: and we know that his testimony is true" (xvi. 24). Yet immediately afterwards—in a sentence which, though omitted by Tischendorf, is supported by the MSS. almost without exception—the singular number is resumed: "I suppose that the world could not contain the books that should be written." This passage certainly seems to indicate some kind of joint authorship or revision, or at all events a desire to convey the impression of joint authorship or revision, such as the Muratorian fragment describes. The theory of joint authorship or revision is confirmed by evidence derivable from the 1st Epistle of John, which is justly regarded (Lightfoot, *Contemp. Rev.*, 1875) as a kind of postscript to the Gospel. It begins (like the Gospel, and unlike the Apocalypse, as also unlike the 2d and 3d Epistles of John) without mention of the author's name, and in the plural number: "That which was from the beginning, which we have heard, which we have seen with our eyes, which we have looked upon, and our hands have handled, declare we unto you, that ye also may have fellowship with us." Yet at the conclusion of the first chapter, as though it were to be understood that the whole was written "in the name of John" ("suo nomine," as the Muratorian fragment has it), the singular number is used, "these things write I unto you" (1 Jo. ii. 1, 7, 12, 13, 14, 21; v. 16).<sup>1</sup> So far therefore as we have gone, the evidence is very decidedly against the supposition that John the apostle was the sole author of the Fourth Gospel. He may have written it (1) through an amanuensis or disciple, who translated his language (and possibly his thoughts also) in the process of expressing them (just as Paul is said by some to have written the Epistle to the Hebrews in Hebrew, and to have had it freely rendered by one of his followers);<sup>2</sup> or (2) it may have been an attempt on the part of a leading teacher of the Johannine school at Ephesus to reproduce the spirit of their master's teaching after he had been taken from them by death, an attempt of one of the Ephesian elders to reproduce John once again in their church, surrounded by Andrew and Philip and Aristion and the rest of the disciples of the Lord, the former proclaiming and all the rest assenting to "that which they had heard, that which they had seen with their eyes."<sup>3</sup> If during the latter years of his life John was infirm and bedridden, obliged to preach and teach by deputy,<sup>4</sup> it is obvious that the "teaching of John" during the last eight years of his life, when the old man was now past ninety years of age, might be

<sup>1</sup> Of course the "we," whereby the writer identifies himself with his readers (ii. 3 and *passim*), is quite different from the "we" mentioned above.

<sup>2</sup> The statement that Papias "wrote out the Gospel at the dictation of John," quoted by Westcott (*Canon*, p. 76) from an argument prefixed to an MS. of the 9th century, is probably worthless, except as indicating an opinion much earlier than the MS., that John did not himself write the Gospel.

<sup>3</sup> That a similar attempt was made to reproduce, as it were, the authority of Peter by a writer in the 2d century, we have seen above (p. 814) in the account of the Second Epistle of Peter. But the circumstances and prolonged infirmities of the apostle John might make such an attempt far more successful and a far more accurate representation of spiritual truth.

<sup>4</sup> Jerome, *Comm. in Ep. ad Gal.*, vi. 10, quoted in Westcott's *Introd. to St John*.

very different in language, and even somewhat different in thought and substance, from the teaching of the apostle himself; and a spiritual doctrine, taught in the Ephesian church, and based upon three or four traditions affirmed by the aged apostle, such as the tradition of blood and water, might, even in the lifetime of the apostle, become known, within a limited district, as the Gospel according to the apostle John. How different, in language if not in substance, may be a pupil's record of a master's teaching may be perceived from Plato's and Xenophon's records of the teaching of Socrates. But in any case, whatever may be the authorship of the book, it must be admitted to be, so far as we have gone, in the highest degree improbable that John the apostle wrote the Fourth Gospel with his own hand at the age of ninety or nearly a hundred, in the same way in which he wrote the Apocalypse at the age of sixty or seventy or eighty.

Evidence  
from  
quota-  
tions.  
Papias.

*Evidence from Quotations.*—But we pass now to the evidence of the early fathers. Theophilus and Irenæus are the first to quote John by name, but earlier writers, who do not mention his name, quote words contained in the Fourth Gospel. We will take Papias first. He tells us (see above, p. 816) that he used to inquire about the *dicta* of Andrew, Peter, Philip, Thomas, James, John, Matthew, or any other disciples of the Lord, and also about the sayings of Aristion and the elder John, the disciples of the Lord. The order of names is remarkable, and it has been most ingeniously inferred (Lightfoot, *Contemp. Rev.*, Oct. 1875) that John is placed, out of his order of precedence, along with Matthew, because the last two had left written Gospels; moreover the order of the first three, "Andrew, Peter, Philip," quite unlike the synoptic order, is the order in Jo. i. 40-43, which suggests that Papias was aware at all events of the story of the calling of the apostles contained in the first chapter of the Fourth Gospel. We are also told by Eusebius that Papias "used testimonies" from the 1st Epistle of John. This is, of course, no proof that Papias quoted the Epistle with John's name (for quotations of New Testament documents with the name of the author are not common in the earliest writings of the church); but it may be inferred that he regarded the 1st Epistle of John as an authoritative document; and the Epistle is so closely connected with the Gospel that, if the apostle John is proved to be the author of the one, it must follow that he is the author of the other also. But it is important to note that Papias recognized two Johns, both of whom were "disciples of the Lord;" and Eusebius tells us that Papias quoted certain traditions of the non-apostolic John, distinguishing him as "the elder,"—"the elder used to say," &c. Now Irenæus—who speaks highly of Papias, describing him (wrongly) as a "hearer of John" (the apostle),—quotes Papias as one of "the elders who saw John the disciple of the Lord," and who remembered how he (John) had repeated to them certain teachings of the Lord Jesus, to the effect that "the days will come in which vines shall grow, having each 10,000 branches, and in each branch 10,000 twigs, and in each twig 10,000 shoots, and in every shoot 10,000 clusters, and in every cluster 10,000 grapes, and every grape when pressed will give 25 measures of wine. And when any one of the saints shall lay hold of a cluster, another shall cry out, 'I am a better cluster, take me; bless the Lord through me,' &c. (*Apostolic Fathers*, Clark's trans. p. 443). The question therefore arises, Which John is here meant? It seems certain from the context that Irenæus meant the famous John, the apostle: yet he calls him nothing but "disciple," and the tradition imputed to John (though not out of accord perhaps with the imagery of the Apocalypse) is quite unlike anything that we find in the Gospel or 1st Epistle called by John's name. On the

other hand, a passage of the Fourth Gospel (xiv. 2) is quoted by Irenæus (*Adv. Hær.*, V. xxxvi. 2) in connexion, not with John the apostle, but with "elders," and possibly as part of the doctrine communicated to Papias by the "elders" ("the context makes it at least highly probable that the passage was quoted from Papias's 'Exposition,'" Westcott, *Introd. to the Gospel of St John*). But, if this be so, i.e., if a passage of the Fourth Gospel was communicated to Papias, not necessarily by John the apostle, but by "elders," then it follows that among the "elders" who communicated it to him may have been John the "elder." Although this is, in great measure, conjectural, yet, even as a possibility, it becomes deserving of attention, when placed in juxtaposition with the certainty mentioned above; (1) it is possible that a saying in the Fourth Gospel was communicated to Papias, not by John the apostle but by John the elder; (2) it is certain that the only passage quoted from Papias as coming from John (the apostle) is not to be found in the Fourth Gospel and in no way resembles the style or thought of the Fourth Gospel. Again, the 2d and 3d Epistles of John, which have the name of the author inserted, are written, not in the name of John the apostle, but in the name of "the elder," and they were so doubtfully regarded (perhaps on that account) by the church that Eusebius places them among the "impeached (*ἀντιλεγόμενα*) writings," while Origen speaks of them as only possibly genuine, and Jerome attributes them not to John the apostle but to John the elder. Yet Irenæus quotes this 2d "impeached" Epistle, not as the work of John the elder, but (twice) as the work of "John the disciple of the Lord." Evidently there is here, if not confusion, at least a danger of confusion, and one cause of confusion can be immediately indicated. Papias tells us that both John the apostle and John the elder were "disciples of the Lord." Now, for some reason or other, Irenæus, though he quotes Matthew as "the apostle" (*Adv. Hær.*, III. ix. 1) and a speech of Peter as spoken by "the apostle" (*Ib.* xii. 1), appears not to quote the Fourth Gospel except as written by John "the disciple of the Lord," or simply "John" (*Ib.* xi. 1, 2, 3, 7). It cannot indeed be assumed that Irenæus is here (unconsciously) referring to John the elder, and not to John the apostle. On the contrary, the more probable explanation is, that John the apostle was himself called by preference John "the disciple of the Lord," as being "the disciple whom Jesus loved."<sup>1</sup> Nevertheless it remains an unfortunate fact that Irenæus and Theophilus, who are the first to quote John by name, give us no means of ascertaining whether they refer to John the apostle or John the elder, both of whom are described by Papias as being "disciples of the Lord." In this state of confusion we are naturally led to suspect that possibly the two Johns mentioned by Papias (neither of whom, as we have shown above, was probably known to Papias himself) may have really been one; and this suspicion is confirmed by the testimony of Jerome, who informs us that though two tombs were shown in his time at Ephesus, one as the tomb of John the apostle, and the other as the tomb of John the elder, yet some considered the two persons to be identical; "nonnulli putant duas memorias ejusdem Joannis evangelistæ esse" (Jerome, quoted by Kirchhofer, p. 159). We have not evidence to prove this theory, but neither have we evidence to disprove it; and we must therefore leave the question who was the author of the Fourth Gospel

<sup>1</sup> Compare *Fragments*, iii., "John the disciple of the Lord and the other apostles with whom he was conversant." Hippolytus doubles the title (*Christ and Antichrist*, ch. 36), "Tell me, blessed John, apostle and disciple of the Lord." In speaking of the author of the Apocalypse, Irenæus (*Adv. Hær.*, IV. xx. 11) describes him not only as the "disciple of the Lord" but also as the disciple "upon whom Jesus had leaned at supper."

(so far as the evidence of Papias and Irenæus can help us) unanswered and unanswerable. Indeed it cannot be denied that the probability is that Papias did not know of its existence as an authoritative Gospel written by the son of Zebedee. For, had he known it, would he have had "nothing to say" about its origin, about the contrast between it and the Apocalypse about the difference between it and the synoptic narrative, and about the interesting account of its composition given in the Muratorian fragment and therefore current before 170 A.D.? That Papias should have "nothing to say" about Luke's Gospel is intelligible, because the dedication to Theophilus speaks for itself, but why he should describe the origin of the First and Second Gospels and pass over the Fourth, where there was so much to describe and where a joint authorship was not only suggested by tradition but also by internal evidence (John xxi 24), is by no means easy to explain. In the face of this silence we cannot attach much value to the evidence in Papias for the apostolic authorship, derived from the association of John with Matthew in the list of the apostles. Against that evidence, too, such as it is, must be set the fact that the only tradition detailed by Irenæus as coming through Papias from John the disciple of the Lord is one quite unlike the tone of the Fourth Gospel. The latter negative at least neutralizes the first positive, and the scale is thus left unaltered, pressed heavily downwards against the apostolic authorship by the discrepancy of style (when the Gospel is compared with the Apocalypse) and by the external and internal evidence of joint authorship.

Evidence has been drawn from the epistle of Barnabas, the 'Shepherd' of Hermas, the Ignatian letters, the epistle of Polycarp to the Philippians, the works of Justin, and the Clementine Homilies, to show that the authors of these writings used the Fourth Gospel (Westcott, *Canon, passim*, Sanday, *Gospels in the Second Century*, 273-298), and no candid mind can resist the proof that some of them knew and were influenced by the thoughts of the Fourth Gospel, while some even used its language. But it is by no means certain, indeed it is improbable, that they knew of it as a Gospel, and it is still more improbable that they recognized it as a Gospel written by "the disciple whom Jesus loved." Else, how comes it that Justin quotes Matthew about fifty times and the Fourth Gospel once, or not at all?

Moreover, the apparent quotations of the Fourth Gospel in the apostolic fathers show not so much the use of a document from the first, as rather the influence of the common atmosphere of the Asian churches, the floating tradition of the Ephesian school, gradually merging into a definite document. Barnabas, for example, speaks of "water," with a certain mystery, associating it with the "cross", as also Justin seems to do, mentioning the cross and baptism in consecutive chapters (lx lxi) of his *First Apology*. But the Clementine Homilies, amplifying the mysterious efficacy of water, as being the origin of all things, and the direct recipient of the impulses of the Spirit (ch xxiv), give a loose quotation of John iii 5, which seems adapted for the Clementine context by being blended with the baptismal formula previously mentioned by the writer in xxviii 19. "For thus the prophet has sworn to us, saying, Verily I say to you, Unless ye be regenerated by living water into the name of Father, Son, and Holy Spirit, ye shall not enter the kingdom of heaven." It can scarcely be an accident that this same passage is the only passage from the Fourth Gospel quoted in the whole of the works of Justin Martyr. Moreover, in Justin also, as in the Clementine Homilies, it is not so much the Gospel as rather the substance of the Gospel that is given, and thus too in a shape not so developed as that which appears in the Fourth Gospel.

It is worth while to sketch the growth of this passage, for the process is a typical one, and will illustrate many other theological developments. The doctrine of the new birth first appears (but only in its germ) in the synoptic Gospels. "Except ye be converted, and become as little children, ye shall not enter the kingdom of heaven" (Mat xviii 3 cf Mk x 15, Lu xviii 17). But Jesus clearly did not mean that His disciples were to become like little children by becoming ignorant, foolish, or helpless, but only that they must trust the Father in heaven, as earthly children trust their earthly parents, in other words, that they must become children of the heavenly Father, and therefore be born again with a heavenly birth. It was therefore a legitimate development of Christ's teaching to remind Christians (1 Pet i 3, 23) that they had been "begotten or born again" (*ἀναγεννηθέντες*), and Paul describes his converts as "begotten" (*γεννηθέντες*) by himself in Christ spiritually, distinguishing such a birth from the "birth according to the flesh" (Gal iv 23, 29). It was inevitable that the Christians should early associate this spiritual birth with the rite of purification or baptism, with which they would naturally (as John had done) introduce their converts into the church. But further, as soon as the need of this spiritual "begetting" became a part of the teaching of the church, it would have to be protected against the literalism of misrepresenting enemies and of dull unspiritual friends. Jews and Gentiles would argue, "But it is impossible for a man who has once been born to enter a second time into his mother's womb." This argumentative objection would therefore be naturally placed (in the minds of the teachers and catechists of the first century) side by side with the doctrine of Christ. One teacher, treating the subject dramatically, might put the objection into the mouth of an objector in the shape of dialogue, another might state the answer to the objection in his own person. With this explanation we shall at once understand that Justin, though appearing (in the course of an argument upon baptism) to quote the Fourth Gospel once only (whereas he quotes Matthew fifty times), is not really quoting it, but only the floating tradition of the Ephesian elders, when he writes as follows—

Justin *Apol I* lxi

For Christ said Except ye be born again (*ἀναγεννηθῆτε*, Peter's word, 1 Pet i 3 23) verily ye shall not enter into the kingdom of heaven. No that it is impossible for those who have once been born to re-enter the wombs of those that bare them is evident to all. [Here the quotation terminates, without making an reference to water.]

John iii 3-5

'Jesus answered and said unto him, Verily, verily I say unto thee, Except a man (*γεννηθῇ ἄνωθεν*) be born again (or from above) he cannot see the kingdom of God. Nicodemus saith unto Him, How can a man be born when he is old? Can he enter the second time into his mother's womb and be born? Jesus answered, Verily verily I say unto thee, Except a man be born of water and the Spirit he cannot enter into the kingdom of God.'

Note here the inexplicable omission—on the hypothesis that it is an omission. We must bear in mind that in the preceding extract Justin is arguing for baptism by water. How obvious then to quote the words of Christ Himself, "Except a man be born of water and the Spirit," &c. But Justin does no such thing. He gives as a reason for water-baptism the intention that men may not remain "the children of necessity and ignorance," which reason, he says, we have learned from the apostles. He also quotes, suitably enough, the saying of Isaiah, "Wash you, make you clean." Lastly, he quotes a saying of Christ, and omits from it (supposing that he has the Fourth Gospel before him) the very words which tell with greatest force for him, and which indeed make all further argument unnecessary. It is possible, but most improbable, that Justin should quote Matthew fifty times, and a Gospel which he knew to be written by the beloved disciple of the Lord only once, but it is more than improbable—it is inconceivable—that, in this single quotation, he should not only quote inaccurately, but omit the very words that were best adapted to support his argument.

The probability is that Justin's quotation represents one stage, and the Fourth Gospel another stage, of the Christian doctrine of the new birth, and that the Ephesian "usus ecclesiasticus" had not yet come to his knowledge, or, if it had, had not yet superseded the less developed tradition. The stages may be classified as follows: (1) Synoptists, "Except ye become as little children." (2) Justin, "Except ye be born again." (3) a third stage is implied in 1 Pet i 3, 23, and in 21 and it would run thus, "Except a man be born of the Spirit as well as water" (a protest against the Essenistic overvaluation of ablutions, see also *Sibylline Books*, iv 164-174), (4) the inevitable transition hence was to the form in the Fourth Gospel, "Except a man be born of water and of the Spirit." Here the authority of the Ephesian apostolic school arrested the development, which would else have issued in (5) the Clementine stage, "Except ye be regenerated by living water into the name of Father,

<sup>1</sup> The argument is not affected even though we adopt in John iii 3 the reading *ἀναγεννηθῇ* which is unquestionably proved by the Latin renderings to have been a very early reading. Whichever be the reading Justin's omission—as an omission—remains inexplicable.

Son, and the Holy Spirit, ye shall not enter the kingdom of heaven." If (6) "living" had subsequently been omitted, the development would have been completed in a sixth and last stage.

Ignatius.

Take another case of the apparent use of the Fourth Gospel by Ignatius. "I desire bread of God, heavenly bread, bread of life, which is the flesh of Jesus Christ, . . . and I desire drink of God, His blood, which is love imperishable, and ever-abiding life" (*Ep. to the Romans*, ch. vii.). Now here it is true that we have a thought peculiar to the Fourth Gospel. Paul speaks of the "blood" always as sacrificial, the "blood of sprinkling;" and indeed to a Jewish mind, taught to "abstain from blood," the thought of drinking "blood" would be at first extremely repulsive, even as a spiritual metaphor. It is very unlike anything in the Apocalypse, where blood is never "drunk," except by the scarlet woman and the murderers of the saints. But it is an image that must have suggested itself to the church as soon as the Gentiles, unfettered by Jewish associations, began to be imbued with eucharistic thought. Indeed, after the first repugnance had worn away, Jewish thought itself—even Pauline thought, and much more the thought of Jewish Christians trained in the school of Philo—would hasten the adoption of the eucharistic metaphor. For was not the blood "the life," according to Moses? And was not a Christian taught to believe, with Paul, that his individual life was merged and "hid" in Christ's life? Again, it would soon be felt that to speak merely of feeding on Christ's flesh was to present the New Testament in an unsymmetrical and almost maimed aspect. Moses had not only fed his people upon bread from the sky (the manna), but had also given them water to drink from the rock. What had the church to show against this symmetrical display of Mosaic power? It was not enough to say (with Paul) that that same "rock" was really Christ: it was necessary to show that the rock still supplied the faithful with divine drink. And for this purpose, what was more appropriate than the cup of the Lord's blood? Regarded in this way, the metaphor would commend itself speedily even to the Jewish mind. Nay, to the cultivated Alexandrian Jew, it would at once commend itself, as we may perceive from the works of Philo, who uses words so strikingly similar to Christian thought that they might almost seem, to a hasty reader, to have (of themselves) originated the eucharistic miracle of Cana. "Who can pour over the happy soul (which proffers its own reason as the most sacred cup) the holy goblet of true joy, except the cup-bearer of God, the Master of the Feast, the Word?" (*On Dreams*, ii. 38). When such thought as this was floating in the atmosphere of Ephesus and Alexandria, it is impossible to draw from the vague resemblance of the Ignatian passage quoted above any inference that Ignatius was quoting, or even referring to, the Fourth Gospel.

Polycarp.

Nor can we infer any quotation of documents from the fact that Polycarp (*Ep. to Philip*, ch. vii.) mentions Antichrist in language somewhat similar to 1 Jo. iv. 2, 3. "Every one that doth not confess that Jesus Christ hath come in the flesh," writes Polycarp, "is Antichrist; and whoso doth not confess the mystery of the cross is of the devil." The thought indeed is manifestly similar, and the language so far similar as to show that both Polycarp and the author of the epistle lived amid identical traditions of Christian teaching. But the epistle itself testifies that the name "Antichrist," so far from being invented by the author of the epistle, was already current in the church: "Little children, ye have heard that Antichrist shall come." If, therefore, it was a fact that already in Asia there had arisen a sect denying that Christ had come "in the flesh," and that the Ephesian circle of apostles first, and the Ephesian school of elders

afterwards, had denounced such a belief as being of Satan and of Antichrist, and if this was taught to the Ephesian catechumens, and preached in the Ephesian pulpits, in a form sanctioned by authoritative teaching and by repeated use, what more is wanting to explain the similarity between the Epistle of John and that of Polycarp?

Again, it is said that Justin (*Dial.*, ch. 88) imitates Justin John (i. 23) in putting the words "The voice of one crying," &c., into the mouth of John the Baptist, instead of placing them as an evangelical comment (as the synoptists do) on the appearance of the Baptist (Mat. iii. 3; Mk. i. 3; Lu. iii. 4). But this inference is unsound, as can be shown by analogy; for Mark uses also as an evangelical comment (i. 2), "I send My messenger before thy face;" but Matthew and Luke place it in the mouth of our Lord (Mat. xi. 10; Lu. vii. 27); and therefore, according to the reasoning above, we must infer that Luke had copied Matthew, or Matthew had copied Luke, in taking the evangelical comment, and inserting it in a discourse of Jesus! How fallacious would be such a deduction! How much more reasonable to suppose that—in accordance with the inevitable tendency thus to take prophecy, as it were, out of the framework, and insert it in the picture—Matthew and Luke have independently adopted a tradition later than Mark, which transposed Mark's evangelistic application of prophecy, and inserted it in the words of the Lord! But if this is the more probable solution in the case of Matthew and Luke, why not also in the case of Justin and John, the circumstances being precisely the same?

But it has been urged that, although Justin cannot be shown to have quoted the Fourth Gospel, yet his acquaintance with the Valentinians (*Dial.* 35)—"who freely used the Fourth Gospel" (Iren., *Adv. Hær.*, I. viii. 5)—"shows that the Fourth Gospel could not have been unknown to him" (Westcott, *Introd. to Gospel of St John*). Justin's words are these: "There are, and there were, many who, coming forward in the name of Jesus, taught both to speak and act blasphemous things, with whom we have nothing in common, since we know them to be atheists. Some are called Marcians, and some Valentinians, and some Basilidians, and some Saturnilians, and others by other names." Now this mere mention of the Valentinians as one of a number of abhorred sects, with whom the writer has nothing in common, scarcely seems to prove any minute acquaintance on the part of Justin with the opinions or books in use among the Valentinians. But even if it be proved, what is the consequence? Surely this, that Justin, knowing the Fourth Gospel to be freely used by a sect which he stigmatizes by name, altogether abstained from using it himself. Irenæus, who uses the Fourth Gospel, accuses the Valentinians of misusing it; Justin, who does not use the Gospel, brings no such accusation. The natural inference is (if any inference at all is to be drawn from such slight premises) that either he did not know of the existence of the Gospel or of its misuse, or that he knew of its existence and use but did not recognize its authority.

Two more instances must conclude the list. It is found that both Justin and John alter the quotations of Zech. xii. 10 from the LXX. version (*ἐπιβλέψονται πρὸς μὲν ἄνθ' ὃν κατωρχήσαντο*) into *ὄψονται εἰς ὃν ἐξεκέντησαν*: "They shall look on Him whom they pierced;" and the Apocalypse (i. 7) also contains the same word in "they also which pierced Him." But this, as we have seen above, especially as it involves a return to the Hebrew text, is perfectly explicable on the same grounds as those which explain prophecies similarly quoted by the synoptists—viz., a common "ecclesiastical use." Still less can anything but floating tradition be inferred from such an allusion as is contained in Polycarp's Epistle to the Philadelphians: "The Spirit, coming from God, is not to be deceived; for it knoweth

whence it cometh, and whither it goeth." Here, though the words *οἶδεν πόθεν ἔρχεται καὶ πού ὑπάγει* (*ὑπάγει* is a word specially disliked by Luke in his Gospel, and not used by Paul), being identical here and in John iii., do certainly, as Dr Sanday points out (*Gospels*, p. 275), imply "an association of ideas," yet, as the same writer remarks, the thought is different. Polycarp says, "The Spirit knoweth whence it cometh;" John says, "We know not whence the Spirit cometh." This indicates that Polycarp is vaguely alluding to oral and traditional doctrines current in his province (familiar, perhaps, but by no means as yet authoritative), rather than quoting from a Gospel known to be written by one of the foremost of the apostles, the "beloved disciple of the Lord."<sup>1</sup>

The Logos of Justin and Philo.

But it is urged (1) that Justin has the doctrine of the Christian, as distinguished from the Alexandrian, Logos; (2) that he could not have had originality enough to develop this himself, and therefore (3) he must have borrowed this method of thought from the Fourth Gospel. And the following expressions are quoted: "Jesus Christ is, in the proper sense (*ἰδίως*), the only Son begotten of God, *οὖν* His Word (*λόγος*), and First-born, and Power (*πρωτότοκος καὶ Δύναμις*);" "But His Son, who alone is rightly (*κυρίως*) called Son, who before all created things was with Him and begotten of Him as His Word, when in the beginning He created and ordered all things through Him," &c.; "Now, next in order to the Father and Lord of all, the first Power (who indeed may also be called Son) is the Word, concerning whom we shall relate, in what follows, how being made flesh (*σαρκοποιήσας*) He became man;" "The Word of God is His Son" (*Apol. I.*, xxiii., xxxii., lxiii.; *Apol. II.*, x., quoted by Sanday, *Gospels*, p. 234; see also Lightfoot's *Colossians*, i. 15).

But it can be shown (1) that all these thoughts were suggested, and many of these expressions actually used, by Philo in Alexandria (40 A.D.), about a hundred years before Justin wrote; (2) that the personification of the Wisdom of God (and Logos means Wisdom as well as Word) in the books of Proverbs and Wisdom rendered it necessary for orthodox Christians, who accepted these books, to identify this personified Wisdom with Christ; (3) that the generally recognized Messianic reference of Ps. lxxxix. 27, *ἐγὼ πρωτότοκον ἔθηκεν αὐτόν*, leading to the comment, "I will make King Messiah a First-born," resulted in a recognition of "the First-born" (*δ Πρωτότοκος*, מֵאָדָם) used absolutely, as a title of the Messiah (Lightfoot, *Col.* i. 15); (4) that those elements of the Alexandrian theory of the Logos which are inconsistent with the Christian theory furnish no proof at all that the Christian theory was independent of the Alexandrian. It was inevitable that, when the Christians borrowed, they would adopt what was consistent, and discard what was inconsistent, with the belief in the incarnation of Christ.

There is abundant evidence to prove these propositions. Even before Paul wrote the Epistle to the Colossians, and *a fortiori* before the composition of the Fourth Gospel, that instinct which compels men to set the First Cause of all at a distance from matter had impelled Alexandrian Judaism to adopt the belief that the supreme God did not Himself directly and immediately create the world, or manifest Himself to mankind, but indirectly and mediately, through some medium or mediator. The simplest and subtlest metaphor to express this mediateness was Word—more especially in the Greek language, where Word (*λόγος*) might mean reason as well as speech, the word in the thought as well as the word in the sound. Man manifests himself through deeds as well as words; but for the Supreme (with whom to speak is to do) the only necessary manifestation was the Word, the Logos. Dr Lightfoot has shown (*Col.* i. 16) that Philo sometimes regards the Logos as a merely passive instrument, so that he allows himself to use the simple instrumental dative (*ᾧ*) to describe the relation of the Word to the Creator (*ᾧ καὶ τὸν κόσμον εἰργάσατο*), "which mode of speaking is not found in the New Testament;" and elsewhere Philo, even where he uses the prepositional construction (*δὲ* ὅς), expressly likens the world to a house, the Supreme to the builder, and the Logos to the *ὄργανον* or tool (*Of Cain and his Birth*, ch. xxxv.). Moreover, as a city, while as yet only existing in the conception of the architect, may be said to be the reason of the architect, so the world (regarded as perceptible only to the intellect) is said to be the Logos or reason of God busying itself in the work of creation (*The*

*World*, vi.). Philo also describes the Logos as "the archetypal model, the idea of ideas." These passages undoubtedly indicate a great gulf between the Christian and Alexandrian Logos. But other passages abound, which Christians could adopt unchanged, applying them to the incarnate Christ; in particular, the passage quoted above (*On Dreams*, ii. 38), where the Word of God is described as "the cup-bearer of God;" and here follow words which would be fraught with eucharistic meaning for a Christian—"the Master of the feast . . . not differing from the draught itself." Again, the Word is said (*Who is the Heir*, ch. xxxix.) to divide in equal portions among all that are to use it the heavenly food of the soul which Moses calls manna; and the Word is expressly said to be a Person in the following passage (*Questions and Solutions*, 62)—*Question*: "Why is it that He speaks as if of some other god, saying, He made man after the image of God, and not that He made him after His own image?" *Solution*: "Very appropriately and without any falsehood was this oracular sentence uttered by God; for no mortal thing could have been formed on the similitude of the supreme Father of the universe, but only after the pattern of the second Deity, who is the Word of the Supreme Being." Even where Philo describes the Word as the instrument of creation, he speaks of it or Him as "the image (*εἰκὼν*) of God" (*On Monarchy*, ii. 5): "The Image of God is the Word by whom all the world was framed (*ἐδημιουργήσατο*). Further, the Word is frequently called by Philo the "First-begotten (*πρωτόγονον*) Son" and "Eldest Son." The prophecy of Zechariah (vi. 12, according to the LXX.) "Behold a man, the East is his name," which is twice applied by Justin (*Dialogue*, cvi. and cxxi.) to Jesus the Son of God, was applied with curious similarity and difference a hundred years before by Philo, who, although he finds it inappropriate for "a man compounded of body and soul," sees in it a singular appropriateness to "that incorporeal Being who in no respect differs from a divine image. . . . For the Father of the Universe has caused Him to spring up as the Eldest Son" (*On the Confusion*, &c., 24).<sup>2</sup> Many of the very expressions which are sometimes used to show that the Logos of the Alexandrians was impersonal are found applied to God in the Old Testament, or to Christ in the New. For example, if Philo calls the world the "garment" of the Logos, the Psalmist also (Ps. civ. 2), appealing to the Lord his God, says, "Thou coverest Thyself with light as with a garment;" or if the Logos is described by Philo as the "bond" which holds the world together, so also does Paul describe Christ as the Being in whom "all things cohere" (*τὰ πάντα συνέστηκεν*, *Col.* i. 17). Nay, further, he attributes to the Logos that function of "reproving" or "convincing" (*ἐλέγχειν*) which is so strikingly assigned in the Fourth Gospel to the Spirit of the ascended Christ (*Jo.* xvi. 8); "And when He is come, He will reprove (*ἐλέγξει*) the world of sin;" compare Philo—who also adds a remark that suggests the thought (*Jo.* i. 9) of "the Light that lighteth every man"—"As long as the divine Word has not come to our soul, all its actions are blameless; but when the priest, conviction (or "reproval," *ἐλέγχος*), enters our heart like a most pure ray of light, then we see that our actions are liable to blame" (*On the Unchangeableness of God*, 28).

In the face of all these passages (and many others might be quoted) the difficulty would seem to be, at first sight, not to prove that the Alexandrian theory of the Logos was the parent of the Christian theory, but to find any difference between the two. The difference, however, is in reality very great, and very readily explained. Philo looked on the manifestation of God through the Logos as being the old inferior dispensation, while the new dispensation was to be the manifestation of the Supreme as *τὸ δν*, absolute Being. The Logos manifestation of Philo was a manifestation of God through visible creation; the higher manifestation was to be independent of visible objects. The former was the manifestation of "God as man"—i.e., as liable to anger, change, repentance, &c.; it was also (*On the Unchangeableness of God*, xi.) an appeal to fear through rewards and punishments, not strictly true, and not intended for the esoteric sage, but only for the unspiritual multitude. The latter, on the other hand, was the manifestation of God as not man—a fatherly revelation, appealing to love. It followed that Philo not only did not identify his Logos with the Messiah, but would have regarded any such identification with one who had "become flesh" as a degradation. It followed also that, although Philo declared the highest revelation to be a revelation of love, there was really no basis for love at all in it. Of God as *τὸ δν*, Philo could not say that He was good, or holy, or loving, because He was superior to all goodness, holiness, and love: "His existence indeed is a fact which we do comprehend concerning Him; but beyond the fact of His existence we can understand nothing" (*On the Unchangeableness of God*, 13).

<sup>1</sup> The writer is indebted to Dr Hort for the suggestion that the transition may be from (1) "thou knowest not whence He cometh," to (2) "He alone knoweth," &c., and thence, the "alone" being understood, to (3) "He knoweth," &c. Yet, when all due weight is given to this suggestion, it will be difficult to deny that the context of John iii. 8 has little in common with the context in Polycarp, "the Spirit is not to be deceived," and that Polycarp's words indicate rather a vague reminiscence of tradition than a quotation from a Gospel supported by the authority of the apostle John.

<sup>2</sup> Some degree of uncertainty whether to call the Word a person or not appears to be implied in the following passage (*Questions*, 84). "The expression 'one of us' (*Gen.* iii. 22) indicates a plurality of beings, unless we are to suppose that God is conversing with his own virtues;" but Philo seems to incline to the personal theory.

Imagine the early Christian teachers and preachers, in the cities which were earliest influenced by Alexandria, brought into contact with the Alexandrian theory of the Logos, or possibly in some cases (as in that of Apollonius perhaps) themselves trained up in the Alexandrian theory, and now superadding to it the belief in an incarnate Son of God—and what would be the consequence? Not, surely, that they would cast the Logos theory aside as baseless; for how could they deny that “by the Word of the Lord were the heavens made”? or how cancel the words of Wisdom in the book of Proverbs (viii. 22–30), “The Lord possessed Me in the beginning of His way, before His works of old. . . . When He prepared the heavens I was there. . . . I was by Him as one brought up with Him; and I was daily His delight, rejoicing always before Him”? Paul might possibly eschew the actual use of the word Logos, as savouring of men’s philosophy, and alter the *πρωτόγονος*, “First-begotten,” of Philo into *πρωτότοκος*, “First-born,” to prevent the inference<sup>1</sup> derivable from the former title, that the Lord, being First-begotten, was not “Only-begotten;” but how could he, or any Christian who believed Christ to be the Redeemer of all mankind and the Eternal Son of God, do other than adopt the Old Testament theory about the Word of God, and at the same time Philo’s language, so far as it was personal, while discarding all that was impersonal? If Christ was not identical with the Word of God and the Wisdom of God, then there seemed to follow the intolerable inference that He must be inferior to it; but if He was identical with it, then the introduction of Philo’s felicitous language into Christian thought was simply a matter of time.

The introduction would be a very easy process, requiring nothing but a few omissions of expressions implying passive instrumentality (e.g., the instrumental dative), and the addition of an emphatic protest that the manifestation of the Supreme as Love, even though it were through visible objects,—yes, even though it were through the Word of God becoming “flesh,”—nevertheless constituted not an inferior but a superior revelation, the highest revelation of all. To the Logos theory of Philo, which stated that all men were made in the image of the Word, the Christians could add that, through forgiveness and by faith, fallen mankind was destined also to be raised up and conformed to that Word, so that He was the goal as well as the starting-point, the  $\Omega$  as well as the  $A$ ; or, as Paul expresses it, “All things are not only created in Him,” but “to Him (*εἰς αὐτόν*),” Col. i. 16 (Lightfoot). This is accordingly expressed emphatically in the Fourth Gospel. Although “no man hath seen God at any time,” yet “the only begotten Son, who is in the bosom of the Father, He hath declared Him” (Jo. i. 18); and again, “Have I been so long with you, and hast thou not known Me, Philip? he that hath seen Me hath seen the Father” (Jo. xiv. 9).

This is the full Christian development of Philo’s doctrine, as applied to the “First-born” becoming “flesh.” But there is not only no evidence that Justin quotes from any written document exhibiting this development, but rather evidence to the contrary, that his doctrine of the Logos, though affected by the teaching of the Ephesian school, had not yet been imbued with it. For, in speaking of baptism, he calls attention to the fact that, in that rite, God is mentioned *only* by the name of “God the Father and Lord of the Universe; for,” he continues, “no man can utter the name of the ineffable God; and if any one dare to say that there is a name he is incurably mad” (*First Apology*, lx). Looked at in the light of the context, this word *ἄρρητος*, “ineffable,” implies a conception of the revelation of God through Christ hardly reaching the level of the Ephesian doctrine, which teaches that, though God had never been seen, He had been *declared* by the only begotten Son, so that whoso had seen Him had seen the Father. But it is in harmony with what Justin says soon afterwards (*Ib.* lxiii.), that Jesus is also called “Angel” and “Apostle” (compare also Heb. iii. 1); and it harmonizes well too with the doctrine of Philo, that “no mortal thing could have been framed in the similitude of the supreme Father of the universe, but only after the pattern of the second Deity, who is the Word of the Supreme Being” (*Solutions*, 62).

It appears therefore that, although Justin knew certain traditions embodied in the Fourth Gospel, yet (1) it was not read in the church services of the district in the same way as the “memoirs of the apostles”; (2) he did not use the Gospel as an authoritative document; (3) his teaching exhibits less of development than the teaching of the Fourth Gospel. An inevitable inference follows that, if he knew of the existence of the Fourth Gospel as a document, he did not believe it to be the work of the apostle John.

<sup>1</sup> Paul nowhere uses the word Logos to denote Christ; but he uses the expression *ὁ λόγος τοῦ Χριστοῦ* in one place (Col. iii. 16) to denote what is more commonly denoted by the Spirit of Christ, the indwelling presence of Christ in the heart manifesting itself in word; cf. Lu. xxi. 15, *στόμα καὶ σοφία*.

The general conclusion to which we are thus led by the external evidence of quotations is that, although some of the doctrine of the Fourth Gospel, expressed in words similar to the words of the Fourth Gospel, was probably current in the Ephesian church towards the end of the first half of the second century, yet it was not by that time widely used, if at all, as an authoritative document; nor have we proof that it was so used till the times of Irenæus, i.e., towards the end of the second century, by which time the Gospel was authoritatively quoted as a work of John; and those who so quoted it probably meant by “John” John, the son of Zebedee, the apostle.

#### Internal Evidence.

##### *The Fourth Gospel compared with the Synoptic Narrative.*

—In estimating the Fourth Gospel as a history, we must necessarily attach a special importance to those portions in it which cover the synoptic ground; for these will afford us the best means of judging how far the facts of the life of Christ, as well as the language of Christ, may have been transmuted by the author. We will therefore first consider those parts of the Fourth Gospel which afford us an opportunity of comparing it with the Gospels of the synoptists.

The first point of comparison is the greater scope of the Fourth Gospel as compared with the other three. It includes all past time in its prologue, and exhibits the incarnation of the divine Word as but one act in the drama of the universe.

Nor is its scope in space narrower than in time. The limited scenery of the synoptic stage—Galilee, Samaria, Judæa,—is (in spirit, though not in letter) exchanged here for “the world.” As Philo tells us that the tabernacle figured the universe, and that the robes of the high priest represented (*Moses*, iii. 12) the different parts of the world, so the High Priest of the Fourth Gospel, though speaking or working in a narrow province of Syria, is always regarded as officiating at the altar steps of the universe, and bearing with Him the destinies of humanity. “The world” is continually on His lips; and John the Baptist is made to proclaim, even at the very outset of the Messiah’s career, that the Lamb of God will take away the sins, not of “the Jews,” but of “the world.” It is true that Judaism is not ignored. Prophecy is constantly appealed to; and the motive of the Gospel is undoubtedly to show that Jesus is “the Christ” (xx. 31), as well as to show that He is the Son of God. Yet nowhere in the Fourth Gospel is found any marked distinction between the Gentiles and Samaritans on the one side and the Jews on the other, as if the former must be neglected for a time (Matt. x. 5; Lu. ix. 52), and as if the latter were entitled to priority in the offer of salvation; on the contrary, Christ is described, early in the narrative, as preaching to the Samaritans, and the Samaritan faith (far more general than the isolated case of the Samaritan leper in Luke) serves as a foil to the Jewish unbelief. “The Jews,” so far as they are distinguished from others, appear throughout as a nation with whom the writer has no sympathy, as the emblem of rebellious, unspiritual scepticism.<sup>2</sup> Viewing the drama at a greater distance of time than the synoptists, and purposely withdrawing himself to a still more subjectively distant point of view, for the purpose of unity and compression, the author almost

<sup>2</sup> The passages iv. 22; x. 16; xi. 52, though they give a kind of precedence to the Jews, yet treat of the passing of salvation from the Jews to the Gentiles, in the way of climax; and these two or three passages (which occur in dialogue and not in narrative) cannot count for anything against the forty or fifty passages wherein the author, in his own person, speaks of “the Jews” as “murmuring,” “seeking to slay Jesus,” “taking up stones to stone Him,” and always systematically opposing themselves to Jesus.

ignores the minor distinctions of Pharisees, Sadducees, Herodians, scribes, and lawyers, with which the synoptists have made us familiar.<sup>1</sup> Palestine is seen no longer with the distinctions of a neighbouring diversified coast-line, but like a dark mass upon the horizon of the distant East, serving as a foil to the splendour of the rising Sun of Righteousness, which it strives in vain to obscure.

In the miraculous part of our evangelist's narrative especially, there is visible this artistic power of selection and compression. Few miracles are described, not more than eight in all (including the post-resurrection miracle of the draught of fishes), and among these not a single case of exorcism. The element of mere wonder (which comes too prominently forward, at least for a pupil of Philo, in the synoptic miracle on the Gadarene) is carefully subordinated to the symbolical element. It is true that the whole Gospel breathes a supernatural atmosphere. Although the Logos, becoming "flesh" (i. 14), is immediately afterwards called Jesus (i. 17) or the Son (i. 18), and is never henceforth mentioned by the name Logos throughout the whole of the Gospel, yet in reality it is still the Logos, rather than Jesus, that is described in the following pages. The Logos is never (as in Mark) "unable" to work miracles, never liable to "marvel," never "in an agony," never (with the single exception of the scene at the grave of Lazarus in which ἐτάραξεν ἑαυτόν, John xi. 33) "sorrowful and very heavy;" the words ἔλεος, ἔλεειν, σπλαγχνίζομαι occur repeatedly in the synoptists, never in the Fourth Gospel; the Logos "knows what is in man," sees Nathaniel "under the fig-tree," discerns from the first that one of the twelve whom He had chosen is "a devil"; when He asks advice from His followers, it is a mere form, merely "to prove them, for He Himself knew what He would do"; there is not in the drama of the Fourth Gospel (as in Mark) any development of thought or plan in the chief actor; the development must be looked for in the drama taken as a whole, and including the creation, the fall, and all the preparation of the world for the coming of the Word as flesh; but the life of Christ on earth is, in the Fourth Gospel, only one act as it were, in which the previous action of the drama is simply carried on and sustained; the whole of the future, His destined "lifting up," His death, His rising in three days, all lie mapped out before the Saviour, so that He walks in a known country and in light, while all around, friends and foes alike, are stumbling or groping in the dark. In this sense, therefore, it is true that the supernatural element is even more prominent in the Fourth Gospel than in the synoptists. But the miracles themselves are subordinated. Though frequent reference is made to the vast number of them (ii. 23; iii. 2; vi. 2; vii. 31; ix. 16; xi. 47; xii. 37; xx. 30), yet, not only are very few described, but even those few are described rather as "emblems" than as "mighty works." It is remarkable that the word σημεῖα ("signs"), which the synoptists almost always use in a bad sense (to denote the "sign from heaven" demanded by the Pharisees, or the "signs" which the false Christs shall work to deceive, if it were possible, even the elect, Mk. xiii. 22), is the very word selected by John to describe the miracles of Jesus; while the word δυνάμεις ("mighty works"), which in the synoptists generally denotes the works of Jesus, is never used in the Fourth Gospel. Partly, no doubt, the author may have felt that

miracles were made cheap by excessive enumeration, and that the narrative of a multitude of miracles without apparent motive created a stumbling-block rather than a help to philosophic and educated readers. Especially might this be felt in Ephesus, the home of wizards and wonders and "curious arts" (Acts xix. 19), where even the last-called of the apostles had worked cures and exorcisms past numbering (ib. 12). Accordingly the author, though he makes mention of very many miracles, describes none but those which are obviously emblematic. It has been stated above that the 1st Epistle of John was not only written by the author of the Fourth Gospel, but must be considered as a kind of postscript or appendix, commending the Gospel to the church. Remembering, therefore, the important passage in the Epistle (1 Jo. v. 8), which describes the three witnesses on earth as breath (or spirit), water, and blood, and bearing in mind that "blood" in all probability has (among other possible meanings) a reference to the eucharistic wine, we shall not be surprised that the first miracle of all describes the changing of the water into wine. Next is a miracle exemplifying the power of the word of Jesus, where faith is present (iv. 50, and cf. iv. 41); then the Messiah manifests (in the cure of the impotent man) the superiority of the ever-flowing fountain of life to the intermittent power of the pool of the law (v. 3); then comes the eucharistic feeding of the five thousand with bread and fishes, wherein "the Lord gave thanks," εὐχαριστήσας τοῦ Κυρίου (vi. 23), followed by the walking on the water, which is also appended by Matthew and Mark to the eucharistic miracle; then the opening of the eyes of the blind by Him who was the Light of the world (ix. 5); the raising of Lazarus by Him who was the Resurrection and the Life (xi. 25); and lastly, the miraculous draught of fishes, taken at the command of Him who had sent His apostles to be fishers of men, and to cast the net of the gospel (xxi. 6).

In all these narratives, although the common people are exhibited as wonder-struck, yet the impression left on the reader is that, for the Word of God, such works are matters of course, and only important because of their inner spiritual meaning. Philo says (*Life of Moses*, i. 38) that such miracles as the production of the water from the rock by Moses and the like are the sports (παίγνια) of God, and not so really great or deserving of serious attention as the revolutions of the planets. There is no trace of "sport" in any of the works of the Word of God narrated by the author of the Fourth Gospel; yet both he and Philo agree in looking through the letter of the narrative of every miracle to the spiritual essence contained in it, which alone constitutes the importance of the act. Now Philo, in speaking of the creation of Eve from the rib of Adam, declares at once that the literal meaning is fabulous (μυθῶδες); whereas he treats the emission of the water from the rock as historical, although he suggests, as a first explanation, that possibly there may have been a latent spring in the rock. Yet Philo proceeds to deduce his spiritual inferences as freely from what he deems "fabulous" as from what he deems historical. It is not necessary to assume in the author of the Fourth Gospel precisely the same indifference to the distinction between spiritual and historical narrative; but it appears certain that, in his writings, as in Philo's, the historical is subordinated to the spiritual. Not but that the picturesque incidents of each miracle receive from him due attention; but it seems to be for the most part the picturesqueness resulting from the skill of a graphic teacher, rather than from the memory of an eye-witness. Compare, for example, Mark's with John's account of the feeding of the five thousand. There is less motive, less

<sup>1</sup> It has been ingeniously suggested that a distinction is drawn by the author between the "Jews" in the south and the "multitude" (ὄχλος) in Galilee (Westcott, *Introd. to St John*). But the term ὄχλος is also applied to the mixed multitude of pilgrims in Jerusalem at the Passover (xii. 12, 17, 18, 29, 34); and besides, if the author had intended to deny any such distinction, he could hardly have expressed himself more cogently than in xii. 9, where he adds that this "multitude" was of the "Jews" (ὄχλος πλὴν ἐκ τῶν Ἰουδαίων).

art, about Mark's detail than about John's. John's omissions and additions all point to one object, the desire to heighten the Logos and to subordinate the disciples and the crowd. Mark begins by saying that "Jesus had compassion on the multitude;" but the Logos, knowing beforehand "what He would do," determines His course at once as soon as He "lifts up His eyes" and discerns the multitude. In Mark, the disciples come to Jesus begging Him to send the multitude away; in John, it is Jesus who first "proves" one of the disciples with the question, "Whence shall we buy bread that they may eat?" Then (giving a picturesque variety to the story) Andrew, as well as Philip, and a servant-lad (*παῖδάριον*) are introduced, the latter carrying the *viaticum* of the apostles. The loaves, a new circumstance not found in the synoptists, are of an inferior kind, "barley;" and Andrew bases an expostulation on the smallness of the provision. After the command to "sit down," Mark says that they sat "down on the green grass," an epithet natural enough for a speaker perhaps, but inartistic, because too prominent, in a written narrative. John, on the other hand, turns a defect into an excellence, by judiciously connecting the "grass" with the command to sit down, so as to enhance the forethought of the wise Master of the feast, who made provision for the comfort of His guests in the minutest details: "Jesus said, Make the men sit down. Now there was much grass in the place." Lastly, in the synoptic narrative, the gathering of the fragments is the spontaneous act of the disciples; but in John, the feast ends as it began, with the display of the wisdom of the Master, even in the smallest matters, "Gather up the fragments that remain, that nothing may be lost." It is scarcely possible to deny that, in the symmetrical manner in which the story gathers itself around the Logos as its object and centre, the narrative of the Fourth Gospel is far superior to that of the synoptists, and that many of the additional touches of the former are dictated by what has been happily described by Canon Westcott as "an instinctive perception of symmetry in thought and expression."<sup>1</sup>

The same remark applies to the other miracle which John has in common with Matthew and Mark, viz., the healing of the "nobleman's" son.<sup>2</sup> Every detail of difference in John heightens the dignity of the Saviour. In the synoptic account, Jesus offers to go to the house to heal the youth; in John, no such offer is made, and the nobleman and his companions are accosted with a rebuke, "Except ye see signs and wonders, ye will not believe." In the synoptists, the man is represented as living at Capernaum, and Jesus as entering Capernaum, so that the father sends but a short distance; in John, Jesus is represented as remaining at Cana, while the suppliant father journeys thither in person from Capernaum, a distance of twenty-five miles. In the synoptists, the father sends a message, praying Jesus not to trouble Himself to enter his roof, but to "speak the word only;" in John, the father piteously supplicates the Saviour to "Come down, ere my child die." In the synoptists, it is recorded that Jesus "marvelled"; in the Fourth Gospel, He simply pronounces the authoritative words,

"Go thy way, thy son liveth." In the synoptists, Jesus avails Himself of this incident to proclaim, almost as if it were (and probably it was) a development of His work suddenly revealed to Him by His Father, that many of the Gentiles shall be admitted into the kingdom; in the Fourth Gospel, which exhibits no development, these words would necessarily seem out of place, and are omitted. Contrast could scarcely be more complete; and it is not surprising that many commentators, rather than identify such opposites, prefer to suppose that, about the same time in the life of Jesus, two men, both in high positions, had sons at the point of death, in the same place (Capernaum), both of whom petitioned Jesus to heal their children, and both of whom obtained from Him miraculous cure, performed at a distance from the two patients. To some, however, as to the candid author of *The Authorship and Historical Character of the Fourth Gospel*, it will appear more probable that we have the same event, differently described. But those who accept the theory of identity ought to consider how much is involved in it. For the defenders of the difference of the two miracles are undoubtedly justified in drawing a contrast between them in almost every point of spiritual importance (Augustine, *Ev. Joh. Tract.*, 16). If, therefore, the Fourth Gospel is historically accurate, then (on the supposition of the identity of these two narratives) the three synoptic Gospels are historically inaccurate; but if the synoptic narrative is historically accurate, the narrative of the Fourth Gospel must be considered rather a new dramatic version, than an independent historical account; and the same remark will necessarily apply to, and affect our estimate of, all the accounts of miracles in the Fourth Gospel.

Gaining light thus from the comparison of the Fourth Gospel with the synoptists, wherever they occupy common ground, we shall find it useful, before proceeding to the summary of the Fourth Gospel, first to touch on the few remaining points which the fourth has in common with one or more of the three. Luke contains most of these. For example, if we accept the passages Lu. xxiv. 12, xxiv. 40, as being not interpolations, though perhaps additions made by the author to a subsequent edition of his Gospel, it will follow that, in the account of the resurrection, Luke and John agree identically in adopting the traditions (1) that Peter "beheld the linen clothes laid by themselves in the sepulchre;" (2) that the Lord showed His disciples, after His resurrection, His wounded body in token of His identity. In both these cases several minute details are added by John; and this also applies to another important incident which Luke and John have in common, viz., the "entering of Satan" into Judas. Luke records it briefly in two words (xxii. 3), and makes the "entrance" occur some time before the last supper; but John, in a far more powerful scene, reserves the "entrance" for the moment when the "sop" is handed to the traitor by the Saviour, and the disciples seated at the last supper. Here again the incident is the same; but the treatment is very different.

The agony described by Luke (xxii. 44, and, without Luke's additions, in Mat. xxvi. 39 and Mk. xiv. 35, 36), when the Lord prayed that "the cup might pass from Him," and when an "angel" appeared from heaven strengthening Him, may seem, at first sight, to have no counterpart in John. And indeed the synoptic description of the agony in Gethsemane is not adapted for the Fourth Gospel. Inserted in any page of that Gospel it could not fail to jar upon us as being out of harmony with the context. Nevertheless, a remarkable passage in John (xii. 27) appears to bear a striking resemblance to the account in Luke: "Now is My soul troubled." Thus the Saviour

<sup>1</sup> The only points in which this narrative can be illustrated by Philo's remarks (*Alleg.*, iii. 56-8) on the manna are two or perhaps three:—(1) As Philo says that the soul is fed not by earthly food but by "words," so the Gospel says that "words" are the source of life (vi. 68); (2) Philo, speaking of the manna, praises those who seek the food for its own sake and not for ulterior advantage; compare John vi. 26 on the "loaves and fishes;" (3) Philo, speaking of the object of the miracle, quotes Exod. xvi. 4, "that I may prove them;" this may possibly, but not probably, illustrate John vi. 6.

<sup>2</sup> It is here assumed (with Dr Sanday, *Fourth Gospel*, p. 100) that they are the same. The assumption of their difference involves even greater difficulties than the assumption of their identity.

avows a certain conflict in His heart, yet by the very deliberateness (as well as by the publicity) of the avowal takes from it something of the intense and almost passionate humanity of the synoptic narrative. Immediately after these words the Saviour, in the Fourth Gospel, deliberately suggests to Himself the synoptic prayer, and repeats it: "What shall I say? 'Father, save Me from this hour?' But for this cause came I to this hour." At once triumphing over the—from the point of view of the Fourth Gospel—unworthy suggestion, He exclaims, "Father, glorify Thy name." Upon this comes the heaven-sent message, but not (as in Luke) an angel to "strengthen" one "in an agony praying more earnestly;" on the contrary, the voice does but ratify the Saviour's utterance: "I have both glorified it, and will glorify it again." Finally, the author adds, as usual, the babble of the multitude, as a foil to the all-knowing wisdom of the Divine Word: "The people therefore that stood by and heard it said that it thundered; others said, An angel hath spoken to Him." No answer to their doubts and questionings is given by Jesus; but we are left under the impression that the "I" is uttered, neither by thunder nor by any mere angel of God, but by the Father Himself. A soul "troubled"; a prayer to be saved from the trouble; the suppression of that prayer, after more or less of conflict, and the substitution of another prayer in its place; and lastly, a message or messenger (*ἄγγελος*) from heaven—the facts are much the same both in Luke and in John, yet how different is the treatment of the facts, and what a world of difference in the spiritual result!

Almost the only passage in which John adopts a few consecutive words of the synoptic narrative is the narrative of the anointing (xii. 3–8). There is much less similarity between Peter's confession, as recorded in Jo. vi. 68, and as recorded in Mat. xvi. 16; Mk. viii. 30; Lu. ix. 20; but the narratives appear to refer to the same event, and if so, the comparison between the two is most instructive. In Matthew and Mark the confession of Peter constitutes a turning-point in the life of Jesus; it is the sign which convinces Him that, the seed of a living faith having been sown, His work is now done, and that the hour of His departure is at hand: "From that time forth" (Mat. xvi. 21; Mk. viii. 31) "began Jesus to show unto His disciples how that He must go unto Jerusalem, and suffer," &c.; and accordingly the Lord prepares the disciples with the greatest care, and even tenderness, for the all-important answer to the question which He is to put to them, "Whom say ye that I am?" and when the question is answered, pronounces a fervent blessing on Simon, the son of Jona, but better called Cephas, a rock, whose faithful confession is the token of the laying of the foundation stone of the new temple. If Jesus is to be regarded as a man, "who, though He were a Son, yet learned obedience by the things which He suffered" (Heb. v. 8), then in the whole synoptic narrative of the life of Christ there is not a more important crisis than this. But in the Johannine narrative crises are altogether out of place, where all is pre-ordained; and instead of the tender questioning, the inspired confession, and the fervent blessing, we have simply an almost casual appeal of the Lord to His disciples, "Will ye also depart?" which, when a response has been made by Peter, is followed, not by a blessing, but by sad words conveying the assurance that the Word of God, who chose the twelve, knows all their weakness as well as their strength, and cannot be surprised either by confession or by betrayal: "Jesus answered, Have not I chosen you twelve, and one of you is a devil?" Both in the Fourth Gospel and in the synoptists (Mat. xvi. 23; Mk. ix. 33), immediately after the blessing of Peter, mention is made of "Satan" or "Devil." To bless Peter, and to call him

"Satan" immediately afterwards, is consistent with the human Christ described by Mark and Matthew. The difficulty is avoided, in Luke, by omission; but the Fourth Gospel, retaining the traditional mention of the word "Satan," or "Devil," directs it to Judas; upon whom elsewhere the Fourth Gospel (xii. 4–8) concentrates the faults imputed by Matthew (xxvi. 8) not to Judas alone but to all the disciples.

Readers who may think that this last dislocation of the words of Jesus appears somewhat improbable should consider carefully the patent instance which follows. In the synoptic account of the betrayal, Matthew and Mark represent Jesus as awaking the sleeping disciples (at the moment of the arrival of the traitor and his band), with the words, "Rise, let us be going (*ἐγείρεσθε, ἀγωμεν*). Behold, he that betrayeth Me is at hand" (Mat. xxvi. 46; Mk. xiv. 42). Luke alters this; it is too human for him, seeming to imply flight; and therefore he substitutes a command, in the second person, "Rise up and pray, lest ye enter into temptation" (Lu. xxii. 46). But John, while averse to this change of the traditional words, neutralizes their questionable effect by taking them completely out of their context. Accordingly, he places them between the discourse on peace in ch. xiv. and the discourse on the vine in ch. xv., just at the point when we may suppose the Master with His disciples to be rising from the table, purposing shortly to pass quietly from the lighted upper-room where He had been celebrating the last supper down into the streets of Jerusalem, on His way to Gethsemane. Taken in this context, the words are free from all suspicion of haste or trepidation; on the contrary, they betoken authoritativeness and decision. Rising from the sacred meal, and going forth to welcome "His hour," the Saviour says,—as if with the consciousness that He is the High Priest of the World, going forth to celebrate the sacrifice foreordained before the foundations of the world,—“But that the world may know that I love the Father, and as the Father gave Me commandment, even so I do. Arise, let us go hence (*ἐγείρεσθε, ἀγωμεν ἐντεῦθεν*).”

The entry into Jerusalem, the crucifixion, and resurrection, are almost the only remaining events common to the Fourth Gospel with the synoptists. The entry is much condensed, and closely connected with the raising of Lazarus (xii. 18); the lengthy account of the sending for the ass is passed over in the words—"Jesus, when He had found a young ass, sat thereon"; and the acclamations of the multitude and the pomp of the procession are all omitted or lightly touched, as if the gleam of popular favour which so impressed the synoptists scarcely deserved the attention it had received from them. It was a mere consequence of the raising of Lazarus: "For this cause the people also met Him, for that they heard that He had done this miracle." Yet in Matthew (xxi. 11), when the city asks "Who is this?" the crowd replies, "This is Jesus, the prophet from Nazareth of Galilee"—making no mention of the wonder which—according to the Fourth Gospel—was the sole cause of the procession.

After this, John omits the purification of the temple, which he has placed earlier, at the first visit of Jesus to Jerusalem (ii. 15),<sup>1</sup> and passes rapidly to the last supper. Here, as is well known, there are great difficulties in recon-

<sup>1</sup> The purification of the temple, placed as Christ's first public act, is as suitable an introduction to the life of Christ in the Fourth Gospel as the sermon in Nazareth is to the life of Christ in the Third Gospel. In Luke (the Gospel of mercy), the proclamation of the "healing of the broken-hearted" to His friends at Nazareth; in John (the Gospel of the Word of God, in which the words *ἐλεος, ἐλεειν, σπλαγχνίζομαι*, so often repeated by the synoptists, are altogether absent), the purifying of the temple of God,—is the most appropriate commencement of the Saviour's public work. Besides, the prophecy of Malachi

ciling the account of the Fourth Gospel with that of the synoptists. In the synoptists the last supper is (apparently) the passover, in which the Lord bequeathes Himself to His disciples as their sacrifice, giving them His body and blood; in John the last supper, so far as he describes it, is merely the last meal shared by the Master and His disciples, at which He washes their feet, and exhorts them to humility, patience, and peace; and it is expressly described as being "before the feast of the passover" (John xiii. 1). Again, in the synoptists, Mark places the crucifixion at the third hour (9 A.M.), and the darkness is made by all the synoptists to last from 12 to 3 P.M.; but John (who is describing in the crucifixion the sacrifice of the passover, the slaughter of the Lamb of God which was to take away the sins of the world) naturally places the crucifixion later, in order that the Lamb may be slain "between the two evenings," as prescribed in the law; and therefore he does not place even the delivery of Pilate's verdict till the sixth hour, i.e., 12 o'clock, and the crucifixion, consequently, later still. The symbolism which prevails in the Fourth Gospel may incline us generally to accept the synoptists' narrative in preference. But there are special reasons why, at a very early date, a slight misunderstanding, among the Gentile churches, of Jewish custom and of the common tradition may have led to an erroneous supposition that the last supper was the passover meal; and the explanation suggested by Canon Westcott (*Introduction to the Study of the Gospels*, p. 344) seems a very reasonable one. In this case, therefore, the Fourth Gospel must have the credit of dissipating an error which had very early crept into the synoptic narrative (namely, the insertion of the words "The first day of unleavened bread," Mat. xxvi. 17; Mk. xiv. 12; Lu. xxii. 7); nor is it at all unlikely that this rectification came from the apostle John himself. But as regards the hour of the crucifixion, it seems more likely that the account of Mark is correct, not only because it leaves more time for the burial before sunset, but also because the later hour implied in the Fourth Gospel appears naturally suggested by the same symbolism which afterwards finds in the wounded body of Christ a fulfilment of the two prophecies, "A bone of Him shall not be broken," and "They shall look on Him whom they pierced."

Passing now to those details of the crucifixion wherein the Fourth Gospel differs from the synoptists, we find in almost each case but one motive—to enhance the majesty of the Saviour. Even in the arrest of Jesus this motive appears. The synoptists tell us that He was arrested by a "crowd" (ὄχλος), servants, sent apparently from the houses of (παρά Mat.; ἀπό Mk.) the chief priests and elders; and as the moon shone at the full, so brightly that the disciples could discern their Master from some distance (a stone's cast), and perceive His agony, as well as hear the words of His prayer in the stillness of the night, they do not think it necessary to make mention of "lights" or "torches." The Fourth Gospel describes how the "cohort" of the citadel of Antonia is called out, together with the servants of the priests, making up in all, if the whole cohort is meant, five or six hundred men; and these approach, not with "swords and clubs" (as Mk.), but with "torches and lights and arms." Jesus goes forward to meet them, and intrepidly declares that He is the person whom they are

seeking, upon which they "recoiled and fell to the ground." Nothing of all this is found in the synoptists.

Though John agrees with Luke in the tradition that the servant's ear cut off by Peter was the "right" ear,<sup>1</sup> he entirely omits Luke's narrative of Christ's examination before Herod; but this is in accordance with his fixed purpose—while by no means neglecting graphic and picturesque detail—to ignore all petty local distinctions, and to draw none but large and clear outlines on his canvas. Rome and "the Jews" alone appear round Christ on the stage of his drama; not one of the Herods is so much as once mentioned from the beginning to the end of it. The irony of providence, by which Pilate is made to proclaim that Jesus is "King of the Jews" (xix. 20), reminds us of the similar irony by which Caiaphas, not speaking "of himself" but inspired by God, is forced to publish the suffering of the Saviour (xi. 51); and both passages are quite in the manner of the Fourth Gospel. So also is the very natural application of the prophecy, "And for My raiment did they cast lots," to the seamless tunic of Christ. Remembering what stress is laid by our author's teacher, Philo, on the high priest's garments (*Moses*, 14; *Dreams*, 37), which "represent the universe," we shall readily perceive that while the outer garment of Christ is freely given to the four quarters of the world, the inner seamless tunic (χιτών), that which He wears next to His heart, is not to be rent, representing as it does the regenerated world, "those who receive remission of sins through Him" (*Dialogue* liv.).<sup>2</sup>

*The Motive of the Fourth Gospel illustrated by the First Epistle of John.*—It has been said above that the 1st Epistle of John is most closely connected with the Gospel. The connexion is so close, in thought as well as in language, that the former may almost be called a summary of the latter. In the Epistle, even more clearly than in the Gospel, we see the author's habit of dealing rather with elements than with nations or individuals. With the exception of the illustration of "Cain," which he possibly borrowed from Philo (who uses Cain and Abel to denote the earthly and the spiritual principle, *Sacrifices of Cain and Abel*, 1), he prefers to dispense with personal illustrations of principles. He does not, like Paul, speak of Abraham, or Hagar, or Sinai, or Isaac, or Melchisedek, or the Jews, or the Gentiles; but of the world and the flesh, the water, the blood, and the spirit, light and darkness, life and death. In the Epistle, as in the Gospel, we see the rejection of Christ explained, not as a casual outcome of individual caprice or wickedness, but as an inevitable result of the eternal antagonism between light and darkness. In the Epistle, as in the Gospel, the author insists that the new commandment of Christ to "love one another" is really an old commandment which men have had from the beginning: a commandment as old as the promptings of the Light which from the beginning has "lighted every man coming into the world,"—an old commandment only so far made new as it has been brought home to the hearts of men with a quite new intensity by the manifestation of the incarnate Love of God. In the Epistle, as in the Gospel, it is recognized that the antagonism between the world and the spirit, between light and darkness, must go on without truce till one has prevailed; and each man must take one or other side, putting away all hope of compromise. There are two principles, says Philo, contrary to and at variance with one another,—the one represented by the God-loving Abel, the

(iii. 1).—"Ἰδοὺ ἐξαποστέλλω τὸν ἀγγελόν μου, καὶ ἐπιβλέψεται ὁδὸν πρὸ προσώπου μου (John the Baptist), καὶ ἐξαίφνης ἔξει εἰς τὸν ναὸν ἑαυτοῦ κύριος ὃν ὑμεῖς ζητεῖτε,—predicts a "sudden" coming of the Lord into the temple, following on the steps of his "messenger." This prophecy is better fulfilled, if the Lord comes to the temple immediately after the preparation of John the Baptist; and, besides, the "sudden" coming is better fulfilled in the early entry of Jesus (John ii. 14) than by the later entry in the synoptists, which was preceded by a public procession. Thus prophecy, as well as appropriateness, might induce an account of an early purification of the temple.

<sup>1</sup> Note also that the Fourth Gospel is the first to give the servant's name, Malchus. In the same way the *Acta Pilati* for the first time give the names of the two thieves, Dysmas and Gestas.

<sup>2</sup> Only the Fourth Gospel thus distinguishes between the ἱμάτια and the χιτὼν. But compare Lev. xvi. 4, where the χιτὼν ἁγιασμένος is prescribed as the dress for the high priest on the day of atonement; and see also Philo (*Dreams*, 37); and especially note Philo's remark that this χιτὼν is "not easily rent" (ἀρραγέστερος).

other by the self-loving Cain, which must needs be at variance when born, "for it is impossible for enemies to dwell for ever together." In precisely the same way does our author illustrate the same antagonism by the same personality: "Not as Cain, who was of that wicked one, and slew his brother. And wherefore slew he him? Because his own works were evil and his brother's righteous"; and then, relapsing from the unfamiliar method of personal illustration into his habitual language about principles or elements, he substitutes for Cain the "world," and for Abel the "children of God," and bids his readers "marvel not if the world hate you."

In this continuous strife between light and darkness the victory is to be gained by faith,—but faith supported by witnesses; and we read in the Epistle that the object of our victorious faith is "He that came through (διὰ) water and blood, Jesus Christ; not with the (ἐν τῷ) water only, but with the water and the blood; and the Spirit is that which beareth witness, because the Spirit is truth; because they that bear witness are three, the spirit (or breath, τὸ πνεῦμα) and the water, and the blood, and the three are united so as to make up the one" (εἰς τὸ ἓν εἶσι) (1 John v. 6–8).

Passing over many differences of interpretation, and asking, What is the meaning of the water and the blood? we turn to the Gospel, and, in the account of the crucifixion, we find (xix. 34) especial stress laid upon the fact that from the side of Jesus "there came out blood and water; and he that hath seen hath born witness (μεμαρτύρηκεν), and his witness (μαρτυρία) is genuine (ἀληθινή), and he knoweth that he saith true, that ye might believe." In what sense is the "blood" here to be understood? As nourishing? or as cleansing? Almost certainly as cleansing; because above, in this very Epistle, the blood of Jesus is described (i. 7) as cleansing us from all sin. Inferring, then, that the blood signifies a superior purifying or baptismal influence, we necessarily infer simultaneously that the water signifies an inferior baptismal influence. Two purifications are mentioned in all the four Gospels, an inferior and preparatory, and a superior and final: the former is the baptism with water, the latter is the baptism with the Holy Spirit, or (as in Lu. iii. 16) with the Holy Spirit and fire (cf. also Lu. xii. 49). But the conception of "baptism with fire,"—though it is based on the early history of Israel (Num. xxxi. 23), and appears occasionally in the shape of a "fiery trial" of faith, as well as in the fiery tongues of Pentecost—was soon supplanted by one of two other conceptions, either sprinkling with sacrificial blood, or baptism with the Spirit. This higher purification, or baptism with blood, Jesus brought into the world. He not only came working by means of it (διὰ with gen., as above in the passage quoted, 1 John v. 6), but also, in a certain sense, in it (ἐν). That is to say, He himself underwent the higher baptism with blood as well as the lower purification with water, which He received from John the Baptist. "Can ye be baptized with the baptism wherewith I shall be baptized?"—He said to the sons of Zebedee (Mk. x. 38). The agony in Gethsemane, which was that baptism, was typified by Luke in an exudation of "sweat, as it were great drops of blood falling down to the ground" (Lu. xxii. 44). But this baptism was scarcely public enough to be a sufficient fulfilment of the prophecy which predicted that "In that day there shall be a fountain opened to the house of David, and to the inhabitants of Jerusalem, for sin and for uncleanness" (Zech. xiii. 1). When it became recognized that the Lord was this "fountain," and that His blood was the cleansing stream, then the piercing of His side and the visible emission of the purifying blood from the wound became an effective and almost necessary type of the spiritual purification, and the type of the blood of sprinkling, suggested

perhaps by Luke in his description of the agony, fell into the background, being supplanted by the more natural type of the pierced side.

Such a type would all the more commend itself because, without it, the crucifixion might almost seem incomplete. The mere piercing of the hands and the feet might seem an insufficient fulfilment of the prophecy of the "fountain"; and besides, since crucifixion was generally a lingering death extending over many hours, and since the body of Jesus was taken down on the same day on which it had been attached to the cross (and, according to John, only three or four hours after the commencement of the crucifixion), the record of His death, without the spear wound, might seem to justify the statements of those who maintained that Christ never died at all, and that He was a man only in appearance. Therefore, as a proof of His humanity and of the reality of His death and sufferings, no less than as a fulfilment of the prophecy of the "fountain," it was natural that the latest Gospel should insert, and that the church should readily accept, the witness through blood as well as water, which is so emphatically related by the author of the Gospel, and here appealed to by the author of the Epistle.

But the question remains, What is meant by the connexion of the water and the blood with the breath or spirit—"They that bear witness are three, the breath (or spirit), and the water, and the blood"? Philo may throw light both on the number and on the nature of the witnesses. Only to earthly matters did the rule apply that "in the mouth of two witnesses shall every word be established:" heavenly matters required, so Philo teaches, "three witnesses" (ἄγιον δὲ πρᾶγμα δοκιμάζεται διὰ τριῶν μαρτύρων, *Posterity of Cain*, 27). He also calls attention to the fact that Moses declares with apparent inconsistency (1) in Leviticus (xvii. 11) that blood is the essence of life, (2) in Genesis (ii. 7) that breath is the essence of life; and he reconciles the two statements by assigning to men two kinds of life: (1) the irrational, which they have in common with beasts, which life has for its seat (ἐλαχε) blood; (2) the rational, which flows from the fountain of reason (λογικῆς πηγῆς), which has for its seat breath (or spirit), "not (mere) air in motion, but a kind of type and impress of that divine power which Moses calls by a name especially appropriated to it (κυρίῳ ὀνόματι), image (of God)" (*The Worse plotting*, &c., 23). Elsewhere (*Who is the Heir*, 11) he says that blood is the essence of the entire soul, but divine spirit (πνεῦμα θεῶν) the essence of the dominant part of the soul. On the metaphor of the water also Philo throws light. Water and earth, he says, represent the origin, growth, and maturity of the human body; consequently, he tells us, purification by water is that preliminary recognition of one's own nature ("know thyself") which is required from those who aspire to the higher purification. Hence purification by water, he asserts, was appointed by the law as a preparation for the purification by sacrificial blood; and hence the Sacred Word thought meet that the high priest, whenever he purposed to perform the sacrifices ordained by law, should previously sprinkle himself with water and ashes (*Dreams*, 36, 37; *Those who offer Sacrifice*, 1, 2).

If now we could find in the Gospel narrative of the crucifixion some mention also of the breath or spirit, nothing would remain wanting to make up the triple purification and triple witness mentioned in the Epistle, of "the spirit and the water and the blood." Such a mention is probably intended in the willing surrender of the "breath" or "spirit," which is mentioned (xix. 30) in the Fourth Gospel alone [Mk. ἐξέπνευσε, Mat. ἀφῆκε; Luke (xxiii. 46) who comes nearest to John only describes the intention, not the fact, παρατίθεμαι]: "He bowed His head,

and gave up His breath" (or spirit). Thus the meaning both in the Gospel and in the Epistle appears to be the same. (1) Jesus took unto Himself not only (a) the dead fleshly nature of man, typified by water, but also (b) the life and passions of man, typified by blood, and (c) that higher life of man (in virtue of which he is described as made in the image of God), typified by the spirit. (2) In these three departments of existence He made three several sacrifices, pouring forth (a) water and (b) blood from His side, and giving up (c) His breath as the last sacrifice of all.<sup>1</sup> (3) Thus these three sacrifices betoken three several purifications:—(a) the purification, by water, of the body in baptism; (b) the purification of the soul by the death of the lower nature (what Paul calls "the old man"), which partakes in the death of Christ; (c) the purified life of the soul rising from the dead through the Spirit, and living with, and in, the risen Saviour. The two latter purifications are two phases of the same (the former implying dying in the blood of Christ, the latter rising again and living in His Spirit); but there is sufficient difference to warrant a distinction. (4) These three purifications go to make up the one perfectly pure and ideal purification and sacrifice for sin, which is the Lamb of God, the Word (*ἐἰς τὸ ἕν εἶναι*).<sup>2</sup>

Stress has been laid upon this important passage in the Epistle because it appears to be a key to much that we shall find in the Gospel. It reveals an exaggerated notion of the importance of baptism with water, against which the author feels compelled to contend; "not by water only, but by water and blood." Somewhat in the same way Paul uses not water but earth (Philo using water and earth) to contrast the natural man, the mere "living soul," with the "lifegiving breath, or spirit" (1 Cor. xv. 45, 47). But that which distinguishes John from Paul is the use of mystical imagery, arranged with a certain numerical symmetry. Sometimes the imagery is dual, when it describes incompleteness, such as the conflict between the world and the children of God, between light and darkness, between God and the devil. But in other cases it is triple: he appeals to three classes, the children, the young men, the fathers; contending against three enemies, the lust of the flesh, the lust of the eyes, the imposture (*ἀλαζονεία*) of life; and strengthened in their faith by three witnesses on earth, the water, the blood, and the spirit—all of which dimly tends towards that other triple witness which has been inserted in the Epistle by later scribes (v. 7), the Father, the Word, and the Holy Spirit.

If we could be sure that the Second Epistle was from the same pen as the First, then the very great probability that the "elect lady" and the "elect sister" (2 John 1; *ἰβ.* 13) represent two churches might prepare us for similar personifications in the Gospel; yet as this personification is disputed by some, we must not lay much stress on it.<sup>3</sup> Nevertheless we have seen enough of the nature of the Epistle to be prepared (in passing to the larger work by the same author) for a Gospel of types and symbols, a Gospel of selection rather than of continuous narrative, a Gospel in which principles on a large scale rather than individual characters shall be represented, and in which light

and darkness, death and life, the word and the world, the water and the spirit, and the spirit and the blood, shall play no inconsiderable part.<sup>4</sup>

#### *Analysis of the Fourth Gospel.*

As was to be expected from a writer conversant with the system and thought which, for brevity, we call the school of Philo, the prologue of the Gospel opens with a protest against Philo's doctrine of an impersonal or quasi-impersonal Logos. The Logos or Word is at once declared to be (i. 1), not the mere instrument by which the world was made, but the companion of God, and God; a Light, from the beginning shining in darkness, received by some, to whom power was given to be born of God, but rejected by others who were the children of the flesh. John the Baptist is introduced, in marked distinction from the Word, as a "man;" not the Light, but a witness to the Light; and the Baptist declares at the very outset of the public life of Jesus (i. 16) that, though the law was given by Moses, the gifts of divine grace and truth came through Jesus, and that He, being the only begotten Son in the bosom of the Father, has manifested the invisible God to men. The baptism of Jesus by John is omitted; but John bears witness to the visible descent of the Spirit upon Jesus, adding that it "abode upon Him," and he bears record that his own baptism with water is but to prepare the way for Him who will baptize with the Holy Spirit; and that He on whom the Spirit thus descended is the Son of God, the Lamb of God that is to take away the sins of the world. Here, then, at the very outset, we see the thoughts, and one may almost say the *dramatis personæ*, of the Epistle re-introduced in the Gospel—light and darkness, the word and the world, the law and grace, the Father, the Spirit, and the Son. The three grades of purification are not as yet mentioned; yet there is perhaps a side-reference to them in the three grades of the world, *i.e.*, of impure existence, which are alluded to in the contrast between those who are born "of God" (i. 13) and those who are born (1) of blood, (2) of the will of the flesh, (3) of the will of man.

The narrative of the calling of the disciples implies unmistakably that this book is not to follow the common tradition, nor to be a complete narrative, but rather a selection; for it only narrates the calling of six of the twelve, and one of these, Nathanael (significantly described as a man of Cana, where two out of the eight miracles in this Gospel are to take place), is so far from being universally identified with one of the twelve that Augustine excluded him from the number. The earlier names are mentioned in the same order as in Papias (see above, p. 820), and suggest the inference that some of these apostles, or their disciples, dwelling in the neighbourhood of Ephesus, furnished some of the materials of which the Fourth Gospel is composed. Two points are further to be noted in this narrative. (1) In order to enhance the dignity of the central character, the writer causes the inferior characters to revolve around Jesus, conversing with and questioning one another, doubting and erring, before venturing to obtrude themselves upon Him (see, besides this passage, iv. 27, iv. 33, vii. 27, 40-43, xi. 16, xi. 37, xii. 20-22, xiii. 24, xvi. 17; and note how, both in xvi. 19 and in other passages, Jesus, after the manner of a king, takes the initiative in addressing His disciples, instead of their bringing their difficulties to Him unbidden, as they do for the most part in the synoptists).

<sup>1</sup> A somewhat similar compound sacrifice of "blood" and "mind" is described by Philo (*Alleg.*, ii. 15), who represents the High Priest as "having put off the robe of opinion and fancy, and as coming disrobed into (the Holy of Holies) to make an offering of the blood of life (*σπένδειν τὸ ψυχικὸν αἷμα*) and to offer up as incense all his mind to the God of salvation."

<sup>2</sup> No doubt these three sacrifices are also connected, in the author's mind, with the three gifts: (1) the water springing up into everlasting life; (2) the wine of the Lord's blood; (3) the spirit which He breathed into the souls of His disciples.

<sup>3</sup> Dr Lightfoot (*Col.* iii. 12) accepts the personification in 1 Pet. v. 13 as "probably" intended.

<sup>4</sup> The numerical symmetry that pervades this Gospel is fully recognized by Canon Westcott, who sees "three pairs of ideas" running through the work, and "seven witnesses" corresponding to the seven times repeated "I am" (vi. 35; viii. 12; x. 7; x. 11; xi. 25; xiv. 6; xv. 1), and to the seven "signs" of Christ's ministry on earth, followed by one "sign" of the risen Christ.

(2) The second point is the error of Philip in saying, "We have found Him, of whom Moses in the law, and the prophets, did write, Jesus of Nazareth, the son of Joseph" (i. 45). Philip introduced with this slightly pompous and erroneous statement—in a kind of irony highly characteristic of our evangelist—seems intended as a contrast to the humiliated and wiser Philip of the fourteenth chapter: "Have I been so long time with you, and yet hast thou not known Me, Philip?"

The first  
"sign."

The next chapter (ii.) opens with a "sign," of which the symbolism is obvious.<sup>1</sup> The water changed into wine evidently typifies the substitution of grace for the law. It was a common metaphor among the Jews to express the superiority of the oral tradition to the written law by saying that "the law is water, but the words of the scribes are wine"—a metaphor that exactly recalls the words of Origen about this very sign: "Before Jesus the Scripture was water, but from the time of Jesus it has been made wine for us" (*Comm. in Ev. Joann.*, xiii. 60). A somewhat similar comparison of old wine and new wine had been adopted by Jesus Himself to illustrate the difference between His teaching and the law of Moses. The identity between the purifying blood of Christ's sacrifice and the nourishing blood of His sacrament is understood even by Justin independently of the Fourth Gospel, and would be a natural inference from the Messianic prophecy (Gen. xlix. 11), which identified the cleansing stream that was to purify the robe of the Messiah with the blood of the grape, declaring that He should "wash His robe (*i.e.*, as Justin explains it, His church) in the blood of the grape." Therefore, in changing water into wine, the Messiah is, by His first sign, striking the key-note of all that is to come, indicating the object and nature of His work, viz., the supersession of the law by the gospel, and the introduction of a new spiritual nutriment and purification, which shall at once cleanse and strengthen and gladden the soul—all this to be effected by and in Himself through His blood.<sup>2</sup>

Prediction  
regarding  
the  
temple.

The prediction here made of "the hour" when the "blood of the grape" should stream from His wounded side is at once followed by a second similar prophecy. After leaving Cana for the passover in Jerusalem (where He purifies the temple by expulsion of the money-changers ;

<sup>1</sup> It is true that the symbolism of this "sign" is not indicated in the text in the same clear manner in which the symbolism of the feeding of the 5000 is avowed (vi. 32, 33); but there is a clear reference to it in the words (ii. 4) "Mine hour is not yet come," which seem to look forward to the hour when the "blood of the grape" should stream from the wounded side of Jesus. It may be necessary to point out, at the outset of this analysis, that the language of the Gospel may naturally have been affected, not only by the thought and language of Philo, but also by what was called the "Asiatic" style, which was prone to metaphor and symbolism: see Lightfoot's *Galatians*, p. 362, where we find that Polycrates, bishop of Ephesus (born or converted about 130 A.D.) described John (probably metaphorically) as a priest, wearing the *πέταλον* or high priest's mitre, and speaks of Melito as a "eunuch," meaning merely that Melito devoted himself to Christ ("propter regnum Dei eunuchum"). It is noteworthy in this context, that the Epistle to the Ephesians is the only Epistle that appears to contain an extract from one of those early hymns which, as Pliny says, the Christians used to "sing to Christ as a god," and this hymn, as is natural, deals in metaphor: "Awake thou that sleepest, and arise from the dead, and Christ shall give thee light" (Eph. v. 14). Probably from some such Asiatic metaphor (that "John, though dead, still breathed in the church") arose the tradition, of which mention is made by Augustine, that the earth over the apostle's body still rose and fell with his breath.

<sup>2</sup> This narrative may be abundantly illustrated from Philo. (1) He speaks of "the veritable High Priest," who pours forth a libation of "pure wine, namely himself" (*De Somniis*, ii. 27); (2) he connects this High Priest with the Logos by describing the Logos as a priest having for his inheritance the Eternal (*τὸν ὄντα*), a priest of the most high God (see also *De Somniis*, i. 37); (3) he speaks of this priest (under the type of Melchisedek) as substituting wine for water: "Melchisedek shall bring forward wine instead of water, and give your souls to drink" (*Allegories*, iii. 26).

see above, p. 827), Jesus answers the request of the Jews for a sign with these words, "Destroy this temple, and in three days I will raise it up." It is added that He "spake of the temple of His body."<sup>3</sup> It is interesting to note four different stages of development in the expression of this prediction. The synoptists Matthew and Mark declare that a very similar charge (differing only in "I will destroy" and "I am able to destroy," Mat. xxvi. 61; Mk. xiv. 58) was brought against Jesus by false witnesses; and they give us no hint that the witnesses erred by a simple and natural misunderstanding. Luke, however, who not only wrote after the destruction of Jerusalem (when it would be a common saying that the Lord Jesus had destroyed the temple), but also modified his Gospel in many respects to suit it to the requirements of the changed times, makes no mention of any false accusation. In his subsequent treatise of the Acts he goes a step further; for there the accusation is repeated (Acts vi. 14), and not denied. Now, lastly, the author of the Fourth Gospel adopts the charge as in the main a true one, or at all events as an inevitable misunderstanding in which His disciples, as well as His enemies, participated. At the same time, this prophecy, like the symbol of the wine, prepares the way for Christ's subsequent doctrine (xiv. 23) that every man is a temple of God, and that He Himself is that Temple in the highest sense. This doctrine had been taught even before Paul by Philo, who scouts the thought of preparing for the Supreme a "house of stone or wood," and declares (*Cain and his Birth*, 20) that the invisible soul is the terrestrial habitation of the invisible God. Yet though Philo's language may have influenced the language of the Fourth Gospel in such passages as xiv. 23, it is most certain that this doctrine is a necessary inference from the teaching of Christ Himself, who taught us that the body must be "full of light." There is therefore no essential misrepresentation in this introduction of the Pauline doctrine of Christ the Temple or Church.

<sup>3</sup> An inference has been drawn from the words *Τεσσαράκοντα καὶ ἔξ ἔτεσιν φθομένην ὁ ναὸς οὗτος* (ii. 20), that because the year so indicated would be the same year as that assigned by Luke to our Lord's commencement of His public work, therefore, by their coincidence, the two Gospels mutually support each other. But it seems natural that the writer of this Gospel, an educated Jew, should know both the date of the commencement of the temple and the date as given by Luke of the commencement of our Lord's ministry; and it seems characteristic of the author, by details of this kind (and especially by numbers), to add picturesqueness and realism to his narrative: cf. the 200 pence (vi. 7), the 200 cubits (xxi. 8), &c. However, it must not be forgotten that Origen (*Comm. in Ev. Joann.*, x. 22) throughout his long discussion of this passage assumes that the meaning is "in" not "during" forty-six years. And this seems to be the natural translation of the words—"the temple was built in forty-six years" (although the dative may be used for duration of time, the aorist hardly permits the English version); and if so, the author is under a mistake in supposing that the temple was completed. Yet from this passage (ii. 20), and from other indications of a knowledge of Jewish customs, Messianic expectations, and the geography of Palestine, it has been inferred that the author was a Palestinian Jew. A stronger argument is the author's preference of the Hebrew rather than the LXX. version of the Old Testament (Canon Westcott quotes vi. 45; xiii. 18; xix. 37), which certainly shows either that he used the Hebrew version himself, or that the Ephesian doctrine was based upon that version. The knowledge of the country does not seem to exceed what might be attained by any Alexandrian Jew who had spent one or two passovers in Jerusalem and had travelled for a short time in Palestine; and the geographical argument has been unduly strained by such suggestions as that a "minute knowledge" of the relative positions of Cana and Capernaum is implied in the expression "He went down" (ii. 12). The same argument would show that the author of the book of Jonah had a "minute knowledge" of the position of Joppa (Jonah i. 3), or that the author of the Acts of the Apostles had a "minute knowledge" of the places from which he or Paul "went down" to Attalia, Troas, or Antioch (xiv. 25; xvi. 8; xviii. 22). Any traveller might know that Capernaum was in the low-lying basin of the Jordan, down on the edge of the sea of Galilee, without having a "minute knowledge" of its position relatively to the inland villages of Galilee.

The doctrine of water.

The whole of the next chapter (iii.) deals with purification by water and the spirit. The learned but timid Nicodemus, "the teacher" of Israel (iii. 10), exhibits the blindness of carnal learning as contrasted with the knowledge that belongs to those who are born of the spirit. A third prediction of "the hour" is expressed through a third figure, the serpent in the wilderness. But this figure introduces a new conception, that of faith, an intense *looking* towards Christ, even as the children of Israel looked on the healing serpent.<sup>1</sup> This thought of faith as sight, illustrated perhaps by the statement that Nicodemus had come by night, introduces a few remarks on a subject hereafter to be more amply treated by the evangelist—the difference between the children of light and the children of darkness (iii. 18–21). In the second section of this chapter the subject of water-purification is taken up again by the Baptist, who contrasts his own inferior purification with the higher purification of the Messiah, and his own decrease with Christ's increase, describing himself (almost in the language of Paul) as "earthly," whereas the Messiah is "from heaven." But the Baptist also introduces the subject of faith; the path of life is through faith in the Son of God: "He that believeth in the Son hath everlasting life" (iii. 22–36).

Christ's relations with John the Baptist.

Particularly to be noted is verse 24 of this chapter, in which it is expressly stated that "John was not yet cast into prison." It will be remembered that the synoptists give no account of the public appearance of Jesus till after the imprisonment of John. It was therefore open to the enemies of the church to maintain that Jesus was but a pupil of the Baptist, and that He did not venture to teach till His master John had been shut up in prison. Much more might this be asserted in Ephesus, where, as we have seen, there were some who were baptized only with the baptism of John, and who knew nothing of the Holy Spirit. On this account probably it is that our author introduces Jesus as working by the side of John, before his imprisonment, and even then inevitably, and against His own will, drawing multitudes from the Baptist to Himself. The apostle John himself is one of the first to leave the Baptist for the Greater Teacher (i. 37); but the Baptist also is made to witness, and to rejoice in, the desertion: "He must increase, but I must decrease." And finally, we are told that the superiority of Jesus over the Baptist had become so manifest that the Pharisees had heard that Jesus made and baptized more disciples than John, and upon this, desiring to avoid this appearance of superiority, Jesus retired to Galilee<sup>2</sup> (iv. 1). It would not be possible more effectively to repel every suggestion of the pupilage of Jesus, or of his subordination—even His temporary subordination—to John the Baptist.<sup>3</sup>

<sup>1</sup> According to Philo, the brazen serpent represents temperance, the antidote of pleasure; and he who has strength to behold the beauty of temperance, and to "discern God through the serpent" shall live (*Allegories*, ii. 20).

<sup>2</sup> The insertion of the remark that "Jesus himself baptized not, but his disciples," serves two purposes:—(1) to magnify the Messiah; (2) to disparage the mere baptism with water.

<sup>3</sup> It is, of course, possible that here (as in the matter of the last supper) the Fourth Gospel may have preserved some historical traditions concerning the acts of the Lord in Judæa, which have not been preserved in the synoptic record. Nor is it denied that elsewhere, e.g., in the matter of the three passovers, the Fourth Gospel may be historical. There is scarcely evidence enough to admit of absolute demonstration on either side. All that is contended is that, whether historical or not, the incidents recorded in the Fourth Gospel are suggested (1) often by a clearly discernible motive in the mind of the writer contrasting forcibly with the motiveless, simple, inartistic narrative of St Mark; (2) sometimes by a desire to supplement, if not to correct, the previous narratives of the synoptists. The presence of such a motive and desire is not, of course, absolutely inconsistent with historical accuracy; but, the more we consider the synoptic narrative to be objective, and the more we consider the Fourth Gospel to be subjective, the more we shall be disposed to believe that, in proportion as incidents in the latter are suggestible by motives and desires, in that proportion are

Now follows (ch. iv.) what may be called the foreign section of the Gospel. We noticed that, even in Luke, the Samaritans assume a prominent position, their faith and unconventional goodness being twice contrasted with the carnal formalism of the Pharisees, at one time in a miracle (Lu. xvii. 16), at another time in a parable (Lu. x. 33). We are now to see how the contrast between Samaria and Judæa is handled in the Fourth Gospel in the dialogue on the living water, which might fairly be called, from its subject, as from its scenery, the "Dialogue of the Well." The well is a frequent figure in the books of Philo. To all men, says Philo (*Planting of Noah*, xix.), there is, in common, the desire to find drink; but some seek drink for the body, others for the soul. The seekers after truth are as those who dig wells, and many seekers have dug wells without finding water; and taking the LXX. version of Genesis xxvi. 32, "We have not found water," he comments on the well of the oath (Beersheba), which is discovered to be "dry"; and he declares that the dry well illustrates the failure of all human search after knowledge, as compared with the ideal God-given knowledge which is like a gushing spring. Elsewhere (*Dreams*, ii. 2, *et seq.*) he says, even more explicitly, that the well is the emblem of knowledge; that its depth signifies the difficulty of the attainment of knowledge; and that concerning all knowledge the well-diggers have to make but one sad confession, "We can find no water." Moses sits by the well "waiting to see what water God will send forth for his thirsty soul" (*Alleg.*, ii. 4); Israel "sang the song of the well," i.e., sang a song of triumph at the discovery of knowledge (*Dreams*, ii. 4); and the remark of the daughter of Samaria (iv. 11) that "the well (*φρέαρ*) is deep," followed by the contrast of the "fountain" (*πηγή*) of water that "leaps up" (iv. 14), at once suggests Philo's contrast between the bond-woman Hagar at "the deep well" and Rebecca who nourishes those who come to her with "the fountain that never fails" (*Posterity of Cain*, 41). Origen, in the same way, considering Jacob's well to mean the Old Testament, contrasts Samaria leaving her *ὕδρια* (the old implement of knowledge) with Rebecca at the fountain (*Comm. in Ev. Joann.*, xiii. 10 and 29). The four wells dug by the patriarchs Abraham and Isaac represent (*Dreams*, ii. 3, 4) four departments of knowledge. The fourth and dry well represents the search after the fourth and incomprehensible immaterial element corresponding to the material heaven—a search that is necessarily fruitless. This being Philo's interpretation (and he indignantly protests against any other, as being unworthy of wise men), we shall also see a singular propriety in placing the dialogue on the living water in the neighbourhood of "the parcel of ground that Jacob gave to his son Joseph" (iv. 5); for here also Philo has prescribed a metaphorical interpretation, declaring that "Jacob gave Joseph Shechem, mean-

they likely to be non-historical, especially if they appear to be difficult to harmonize with the earlier narrative of the synoptists. It has been suggested that the lamentation over Jerusalem (Mat. xxiii. 37; Lu. xiii. 34), expressed in the words, "How often did I desire to gather together thy children . . . and ye would not," implies many previous visits. These words were no doubt spoken in Jerusalem, where Matthew (not Luke, see p. 800, above) places them; but still, may they not refer to the many occasions in Galilee where the Redeemer, striving to "gather together" the children of Israel, had surely included the "children of Jerusalem" in the scope of his efforts? Even if the words "thy children" are to be taken literally, they may refer to the occasions when the scribes and Pharisees had come down from Jerusalem to test the Messiah, and Jesus had proclaimed the new kingdom to them in vain. Though preaching in Galilee, Jesus was really conflicting with the spirit of Jerusalem, and striving to "gather together the children of Jerusalem." In any case the supposition that *πορεύς* refers to previous public visits to Jerusalem results in an incompatibility. For no one maintains that Jesus had made more than two previous public visits to Jerusalem; and it is impossible that "how many times" can mean twice.

ing thereby the bodily things which are the objects of the outward senses" (*Allegories*, iii. 8). But there is also an appropriateness in the use of the name (iv. 5) "Sychar." For whether the name be a corruption of "Shechem" or of "Askar" (Sanday, *Fourth Gospel*, p. 93), in either case the name contains a possible reference to "drunkenness" (Isaiah, xxviii. 1, 7; *Dict. of Bible*, s.v.), and serves as a suitable contrast to the Living Water. The next point for consideration is the "five husbands" of the woman of Samaria. Is there any special meaning in the number "five?" Turning again to Philo, we find, a little after the passage about wells quoted above, the statement that "the number five is appropriate to the outward sense" (*Planting*, 32), and that it represents material enjoyment. This is certainly a natural use of the number, if it is to be used emblematically.<sup>1</sup> Further, the number "five" is connected also by Philo, not indeed with "husbands," but with "seducers." Philo (*Allegories*, iii. 88) says that the lawful husband is the mind (*νοῦς*), the unlawful husband or seducer (*φθορεὺς*) is represented by the five objects of the senses working through the five senses.<sup>2</sup> Immediately before the passage, Philo adopts the more common metaphor of the Old Testament in speaking, not of the mind, but of the Lord Himself, as the Husband, being the Father of the perfect nature, and sowing and begetting happiness in the soul. Samaria is supposed by Justin (*Dial.* lxxviii.) to represent in Isaiah (viii. 4) "sinful and unjust power;" but here it rather typifies sense-wrapped ignorant unbelief. The whole of this imagery seems so well connected and so appropriately transferred from the pages of Philo to the pages of the Fourth Gospel, that one hesitates to accept another explanation (Keim) which would otherwise seem extremely probable—an explanation borrowed from the five religions of the five nations of Samaria (2 Kings xvii. 30-37). In either case, the sixth "husband" may very well refer to Simon Magus, who, as we know from the Acts of the Apostles (Acts viii. 11), had very early in the history of the church "for a long time" held the Samaritans "bound with his enchantments."<sup>3</sup>

Like all the other narratives of our evangelist, this narrative is in the highest degree dramatic. From her previous repellent attitude, the woman of Samaria is led, first into wonder, then into interest, then into conviction of sin (becoming ashamed of her false husbands), and into admiration of the New Prophet; lastly, she receives from the Messiah a draught of that spiritual water which alone can satisfy the longing soul; and in the climax she is brought to the very brink of the eternal fountain—"I that speak unto thee am He."

The journey into Galilee adds one more to the instances in which the Fourth Gospel corrects the synoptists. The saying that "a prophet is not without honour save in his own country" is stated by the synoptists to have been

uttered by Jesus in Galilee (Mat. xiii. 57; Mk. vi. 4; Lu. iv. 24) *after* the unexpected rejection of Him by His countrymen; and Mark adds one of those passages which were early "stumbling-blocks" to the church, viz., that "He was not able to do there any mighty work, . . . and He marvelled because of their unbelief." Not content with Luke's considerable modification of this passage, the author of the Fourth Gospel boldly places this saying of Jesus *before* the visit to Galilee, and assigns it as *a reason for His going thither*: "After two days He departed thence (from Samaria) and went into Galilee; *for* Jesus Himself testified that a prophet hath no honour in his own country" (iv. 44). The motive is obvious: Jesus is desirous of escaping from notoriety. He has found that the Pharisees (iv. 1) are aware of His superiority to John the Baptist, and that His disciples exceed John's in number; and for this very reason He leaves Judæa, and comes to Samaria, a hostile district. Even here, however, He cannot help making converts. But having made them, He leaves them and goes into Galilee, where at least He is sure to find "no honour." Yet even here, adds the author, *He was honoured*; for "the Galileans received Him, having seen all the things that He did at Jerusalem at the feast" (iv. 44). Thus skilfully, after his manner, the author takes those very sayings and traditions which had been turned against Jesus, and, by his delicate handling, uses them to enhance the glory of the Messiah, "who knew what was in man" (ii. 25).

Passing over the cure of the nobleman's son, which has been discussed above, we come to the first "sign" wrought on the sabbath (v. 2-9). Once more there is a contrast between the water of the law and the fountain of the Messiah. The rejection of this divine act of mercy, simply because it was wrought on the sabbath, introduces, almost for the first time, the conception of "judgment" or "condemnation." The word "judgment" had been mentioned in the dialogue with Nicodemus, as a necessary result, though not an object, of the coming of the Light, which, by its very presence, distinguishes and "judges" those who love the darkness (iii. 17-21); and now we have an example of the way in which the Light divides all who hold it into two classes—those who love it, and those who hate it. This is in accordance with the spirit of the synoptists, who (Mat xxiii. 13; Mk. xii. 40; Lu. xx. 47) describe Jesus as addressing the sabbatarian sign-hinderers as "hypocrite," and as pronouncing on "hypocrites" greater "judgment" or condemnation (*περισσότερον κρίμα*). But that part of the discourse in which Christ describes Himself, in the presence of the multitude, as having received all power to judge and to quicken the dead, does not resemble anything in the synoptic narrative, except the discourse—"All things are delivered unto Me of My Father" (Mat. xi. 27; Lu. x. 22); and that was uttered privately to the disciples, after their return from their mission. It is possible that the author here (as elsewhere) sets down, as a public discourse, some sayings that may have been uttered privately; and the words "that all men should honour the Son, even as they honour the Father," remind us at once of the synoptic saying, "He that receiveth you receiveth Me, and He that receiveth Me receiveth Him that sent Me" (Mk. ix. 37, &c.); which again, in the synoptists, was a private, not a public saying.

The author's fidelity to the spirit rather than to the letter of the words of Jesus appears also in the reference to the quickening and raising from the dead. Jesus had in Matthew (x. 8) bidden His disciples to "raise the dead," and this precept is amplified, in the Fourth Gospel, into "The hour is coming and now is, when the dead shall hear the voice of the Son of God; and they that hear shall live" (v. 25),—a saying that would naturally be inter-

<sup>1</sup> Origen (*Comm. in Ev. Joann.*, xiii. 9) speaks of "the five husbands as corresponding to the five senses;" and he says that Samaria is the type of a soul which has once been wedded to the objects of sense, but has recently divorced herself from these and allied herself to a "sixth husband," a false semblance of spiritual truth. If this stood by itself, we might regard it as one of many other specimens of Origen's baseless allegory; but it assumes importance when we find Philo, who wrote long before the composition of this Dialogue of the Well, using nearly the same language as Origen, who wrote after it (and apparently) without any knowledge of Philo's pre-existing metaphor.

<sup>2</sup> Elsewhere (*Migration of Abraham*, 37) he says that the "five daughters" of Salpaad represent the "outward senses." The same thing is represented (*Abraham*, 5) by "the five cities of Sodom."

<sup>10</sup> Yet the "sixth husband" may possibly be illustrated by the contrast which Philo (*Abraham*, 6) draws between the "seventh power," the "power of peace," and the "six powers of turbulence," which consist of "the five senses" and uttered "speech" (*ἡ προφορικὸς λόγος*) which prates of things that should not be uttered (*ἀχλαίνῃ σόματι νυρία τῶν ἡγουχαμένων ἐκκαλῶν*): see Rev. xvi. 5.

The doctrine of faith

preted in a purely spiritual sense.<sup>1</sup> No less spiritual is the doctrine here enunciated on faith. As elsewhere in this Gospel (i. 50; iii. 1, 2; iv. 39-41; xx. 29; and, if rightly considered, vi. 26), the author lightly esteems belief based on "mighty works" or wonders. The right faith is that of the Samaritans, who, rising out of the lower wonder-faith, attain to the higher faith which comes from hearing Christ (iv. 42). For to this, and to no other testimony, does Christ, in the Fourth Gospel, make His ultimate appeal. Christ does not indeed despise the testimony of John to Himself, but He does not accept it as a final basis for the true faith (v. 32-34). He appeals to the Scriptures, it is true, but rather as an unerring guide to the true source of faith than as being of themselves able to generate faith in the reader (v. 39). What then is the living final testimony to which He appeals? It is to His "works,"—not the "mighty works," or "wonders," but all "the works (*ἔργα*) which the Father hath given Me to do," meaning the whole of His life, and including both words and deeds. In other words, the Fourth Gospel appeals to that which we should call the influence of the life of Jesus, but which the evangelist better calls the "Spirit" of Jesus, passing from Jesus to His disciples, and from those disciples to others who had not seen Jesus—as the final testimony, convincing every honest heart, and generating in every conscience that loves the light a belief in Jesus as the true Light. In the synoptists, "faith" is, for the most part, that half physical thrill of trust in the presence of Jesus which enables the limbs of a paralysed man to make the due physical response to the emotional shock consequent on the word "arise," so that in the strength of that shock the paralytic is enabled to shake off the disease of many years; or, at the highest, it is a thrill through the inner being, whereby the soul shakes off the burden of sin. But in the Fourth Gospel faith implies even more than in Paul's Epistles; it is a faculty that tests, transmutes, and develops the recipient soul; it means a trust in Christ, not only as a sacrifice, nor as propitiation, nor as miracle-worker, nor as Son of God, but as source and object of all love, and the be-all and end-all of every human life. If such a Being is best expressed by "Word," then the human receptiveness of such a Being will be best expressed by the metaphor of "hearing." Accordingly the Samaritans believe, not because of miracles, nor because He told the woman "all that ever she did," but because they had enjoyed His presence for two days, and had *heard* Him. "Now we believe, not because of thy saying; for we have *heard* Him ourselves, and know that this is indeed the Christ, the Saviour of the world." Here we have at last a doctrine not borrowed from Philo, a doctrine that constitutes the great difference between Philo's philosophy and the religion of the Fourth Gospel, making the latter a powerful and life-inspiring motive for all classes of men, while the former remains a barren philosophy fit only for meditative hermits. For in Philo, faith, as in the Old Testament (Lightfoot, *Galatians*, pp. 154-162), has a passive meaning—trustworthiness, stability, constancy,—rather than the active meaning of trust, by which the lower nature is raised to the level of the higher; the "dog" to the level of "man" (Bacon, *Essays*, xvi. 79); the man to the level of Christ, and, through Christ, to God (1 Cor. iii. 23). Faith, in Philo, is a prize rather than an effort, a harbour rather than a voyage; it is "the only sure and infallible good, the solace of life, the fulfilment of worthy hopes" (Lightfoot, *Gal.*, p. 158); whereas, in the New Testament, it is the faculty by which one is able to trust in Christ, to love Christ, and to serve Christ—a faculty implying continuous effort, loyal and enthusiastic service, and progressive activity. The

<sup>1</sup> Compare Philo, *De Profugis*, 10, "Some that are living are dead; and some that are dead live."

nearest approach in Philo to the Pauline and Johannine faith is perhaps in the words that describe it as "the entire amelioration of the soul which leans for support on Him who is the cause of all things, who is able to do all things, and willeth to do those which are most excellent" (*ib.* p. 158); but even this, though the same in theory, is very different in practice from the faith of the New Testament. For—faith being neutral and colourless and taking its colour from its object—how different must needs be even the faith that is based upon the *things* that are "most excellent" from the faith that rises to the Father through such a one as Jesus of Nazareth, concerning whom even the most incredulous must admit that He made peace in man's troubled heart, banished sin from those who trusted in Him, and "constrained" (2 Cor. v. 14) even His bitterest persecutor to join in laying the foundations of His empire.<sup>2</sup>

In the discourse that follows the miracle of the feeding of the five thousand,<sup>3</sup> it is noteworthy that the author speaks of the eucharistic food not as the Lord's body and blood, but as His "flesh" and blood. Most characteristically: for "flesh" is, as in Paul's epistles, a principle, an element, and the author desires to show that the Lord's flesh and blood are the only satisfying element for the human soul. He has before spoken of blood and flesh and man (i. 13) as antagonistic elements to the divine elements; now he wishes to point out the divine elements themselves, and they are the flesh and blood of the Word, who "became flesh" (i. 14, *σὰρξ ἐγένετο*) for men. Here, as before, we must add that the use of this language—"Whoso eateth My flesh and drinketh My blood"—in a public discourse is quite unlike anything in the synoptists, and though it represents the essence of the teaching of the Lord's supper, somewhat amplified, it can hardly be considered in its chronological, or even perhaps in its artistic place, as a public discourse here. Yet it is necessarily placed here to account for the desertion of many of His followers. In the synoptists the desertion is otherwise explained. There we see Jesus, as He develops the constitution of His Kingdom, alienating, step by step, the Pharisees, Herod, the patriots or Galileans, the followers of John the Baptist, and at last the whole of His countrymen, till He is compelled to flee from Herod to the neighbourhood of Cæsarea Philippi, where, as an exile with no more than twelve other outcast companions, He who had never revealed Himself to be the Messiah finds, upon questioning His disciples, that they have been led by the divine guidance to the sense that He and He alone must needs be their Redeemer; so that the seed of

The confession of Peter.

<sup>2</sup> It is a remarkable fact that this evangelist never uses the noun *πίστις*, which is frequently used by the synoptists, while he uses the verb *πιστεύειν* about twice as often as it is used by all the synoptists put together. He appears to prefer to contemplate faith, not as in itself a virtue, but rather as a mental act or state taking its quality from its object. Note also that he seems to distinguish between *πιστεύειν μοι* and *πιστεύειν εἰς ἐμὲ*. The former is generally used in questions and negations (v. 38; viii. 45, 46; x. 38), or else of temporary and progressive trust, e.g., trust in God, in the word of Jesus, or in the Scriptures; all of which are regarded as preparatory acts leading to that final state of trust which can only be obtained by *coming to Jesus* (iv. 50; v. 24; v. 46; v. 47 (*bis*); x. 38). The latter (*πιστεύειν εἰς*) denotes the final state of fixed trust and repose on Jesus, and it is only once used by the synoptists (Matth. xviii. 6; ? Mk. ix. 42).

<sup>3</sup> Nothing has been said here about the difference of John's chronology from that of the synoptists, because, if the Fourth Gospel is a spiritual rather than an historical composition, it is scarcely to be expected that its chronology should be limited by historical considerations; and, in any case, the subject is too large a one to be discussed here. Canon Westcott remarks (*Gospels*, p. 285) that "a very strong case has been made out by Mr Browne (*Ordo Saeculorum*) for the limitation of the Lord's ministry to a single year. If there were direct evidence for the omission of τὸ πᾶσχα in John vi. 4, his arguments would appear to be convincing." The context suggests that the words τὸ πᾶσχα may not improbably be an insertion based on a sense of the spiritual meaning of the narrative rather than on history.

faith has at last begun to germinate, and He can now prepare to leave them, because He discerns already the temple of the new kingdom founded upon the inspired confession of Simon Peter. In the Fourth Gospel, on the other hand, the desertion of the disciples is represented as due to another cause, namely, their unspiritual dulness and their inability to understand the doctrines of their Master. Here and there in this discourse appear glimpses of the synoptic utterances,—for example, in the words “No man can come unto Me except My Father draw him” (vi. 44); and in the words “It is the Spirit that quickeneth, the flesh profiteth nothing” (vi. 63), one seems to recognize a version of part of the blessing of Peter, “Blessed art thou Simon, son of Jona, for flesh and blood hath not revealed it unto thee, but My Father which is in heaven.” But elsewhere, in the greater part of this discourse, the author departs entirely from the synoptists. In the confession of Peter, a very striking peculiarity is presented. Not only do we find brought out in a very touching manner what may be almost called the despairing faith of the confessing apostle—“Lord, to whom shall we go?”—as though the disciples were driven in desperation to remain with Jesus because, if they deserted Him, they had no hope, no refuge, elsewhere; but we also find Peter avowing the cause of his belief, and it is the same cause as moved the believing Samaritans; it is not the “signs” but the “words” of Jesus—“Thou hast the words of eternal life.”<sup>1</sup>

Hitherto the Gospel has dealt with the Word as purifying and nourishing; now it has to speak of it as enlightening. The types have hitherto been water (under various aspects), wine, flesh, blood, bread; now we are to read of Jesus as Light. This is the highest or nearly the highest doctrine; for it is another aspect of the doctrine of the Spirit. The two doctrines are closely connected in Philo, who (*Creation of the World*, 8) declares that God assigned a “pre-eminence to the elements of spirit (or breath or air) and light, calling the former the spirit of God because it is the most life-giving element, and God is the cause of life;” and the visible light Philo declares to be the image of the invisible light, which is the image of God. In the short summary of Christ’s doctrine set forth to Nicodemus (iii. 3–21), a brief suggestion of the doctrine of the light follows on the doctrine of baptism; now the higher doctrine is to be expanded. But light implies darkness, and therefore the development of the doctrine of light connects itself naturally with the period of conflict between light and darkness, i.e., between the Word and “the Jews,”—a conflict that becomes from this time more and more prominent.

Climax  
of the  
doctrine  
of water.

First of all, however, comes a climax of the doctrine of water, and a preparation for the doctrine of light. This section (vii. 2–40) begins with a very distinct indication, differing widely from the synoptic treatment, of the relations between the Lord and his brethren. It is possible that the Ebionite school based their low views of Christ’s

<sup>1</sup> Although the word used by Peter (*ῥῆμα*) is not the same as that used by the Samaritans (*λόγον*), yet a comparison of a great number of passages in which the “word” of Jesus (*λόγος μου*) is said to be the object of belief, and the source and province of spiritual life (ii. 22; iv. 50; v. 38, the word of God; viii. 31; viii. 37, 43, 51, 52; xii. 48; xiv. 23, 24) seems to show that the name *λόγος* itself had some influence in leading the author to insist so frequently upon the “word” rather than “the works” as being the prime cause by which the incarnate Word generated faith in the souls of men. In the Fourth Gospel the plural *λόγοι* is only once used by Jesus of His words (xiv. 24); and there in a passage where (seemingly) it is desired to distinguish the separate from the collective “words:” “Ὁ μὴ ἀγαπῶν με τοὺς λόγους μου οὐ τηρεῖ” καὶ ὁ λόγος ὃν ἀκούετε, οὐκ ἐστὶν ἐμὸς ἀλλὰ τοῦ πέμψαντός με πατρός. On the other hand, the synoptists frequently represent Jesus as speaking of “my words” and of “the word,” but never of “my word.” Note also the remarkable passage (xii. 48) where it is said that Jesus does not judge men, but that the word which He has spoken will judge them.

nature upon traditions derived, or supposed to have been derived, from the Lord’s brethren, and that the author is here striking at a particular school of thought. Comparing Mk. iii. 21 with Mk. iii. 31, we see clearly that the mother and brethren of Jesus, alarmed perhaps for His safety, and deceived by false reports about His sanity, desired to place Him under restraint; and Matthew and Luke unite in asserting that the mother as well as the brethren desired to speak to Him, and were rejected. But there is no mention of the mother in the Fourth Gospel as ever doubting or ever alarmed concerning her Son; the brethren alone doubt, and their doubt amounts almost to an antagonistic scepticism. They do not “believe in Him,” yet they urge Him to go to “Judæa that the disciples may see the works that Thou doest. If Thou doest these things, show Thyself to the world” (vii. 3–5). No reproof could be more severe (from the point of view with which the Fourth Gospel regards the “world”) than the reply of Jesus: “The world cannot hate you; but Me it hateth.” So imbued are the Lord’s brethren in fleshly worldliness, that the world recognizes in them that familiar darkness which it loves, because its works are dark, while it hates the convicting light. It is not surprising, after this, that Mary, who throughout this Gospel is regarded with affectionate reverence, is not committed to the guardianship of these sceptical brethren of the Lord.

The discourse itself is, as has been said, mainly preparatory. After one brief appeal to the conscience as the final test of the truth of His teaching (vii. 17), the conflict is predicted: “Why go ye about to kill Me?” A hint of the synoptic saying “He casteth out devils through Beelzebub” is perhaps contained in the reply of the people, “Thou hast a devil;” but the author deviates from the synoptists, in the justification of the sabbath-cure, not from the “ass” or the “ox” in the pit (Lu. xiv. 5), but from the practice of circumcision on the sabbath (vii. 22, 23). The violent spirit first manifested after the cure of the impotent man (v. 16, 18) now breaks out again, and a direct attempt made by the Pharisees to arrest Him (vii. 32), frustrated by the wonder of His words (vii. 46; and compare xviii. 6), leads Jesus once more to predict that He will soon pass away from them, and finally to conclude the “doctrine of water,” by exclaiming in “the last day, the great day of the feast, . . . he that believeth in Me, as the scripture hath said, out of his belly shall flow rivers of living water”<sup>2</sup> (vii. 38). The spiritual climax thus given to the doctrine of water is very striking. The well of living water, before promised to the woman of Samaria, is now not merely to spring up in the believer, as there stated (iv. 14), but it is also to flow forth from Him to others, thus preparing the way for the higher doctrine of the Spirit of fellowship which the author touches on in the next verse: “But this He spake of the Spirit, which they that believe on Him should receive” (vii. 39).

The method of the author is admirably illustrated by the dialogue between the people (vii. 41, 42): “Others said, This is the Christ, But some said, Shall Christ come out of Galilee? Hath not the scripture said that Christ cometh

Irony of  
the  
Fourth  
Gospel.

<sup>2</sup> These words have caused perplexity, as not being found in any book of the Old Testament; but they are probably a corrupt reading or reminiscence of the LXX. version of Isa. xlv. 3, 4, “I will give water in the midst of drought to them that walk in a waterless land; I will place My spirit upon thy seed, and My blessings upon thy children—καὶ ἀνατελοῦσιν ὡς ἀνὰ μέσον ὕδατος, &c.” The Greek words quoted above were probably separated from their context; ἀνατελοῦσιν was taken transitively and connected with ὕδωρ (ὕδωρ ἀνατέλλειν, Pind. *Is.*, 6 (5) 111, being a recognized phrase for “to make water gush forth”); and ἀνὰ μέσον was rendered “the middle parts,” ἐκ κοιλίας. Such corruptions of the Old Testament are readily paralleled from Barnabas and Justin, although altogether unlike the method of quoting the Scripture assigned to our Lord by the synoptists.

of the seed of David, and out of the town of Bethlehem where David was?" It is a curious instance of the degree to which the dramatic character of the Fourth Gospel has been ignored, that even an acute commentator has inferred from this passage that John "was not aware of the birth at Bethlehem." The fact is that the author uses these and similar errors and blind gropings of the people, the enemies, and even the disciples of the Lord, to enhance the majesty and insight of Him who walks above them all, high in the light of heaven, while they are creeping in the mist around His feet. He does not stop to correct these vulgar errors, for he presupposes that his readers are in the light, and able to see through them all; and it is with a frequency almost betokening enjoyment that he repeats this device over and over again, in every case holding up the error in silence to the contempt or pity of his reader, and delighting to exhibit human folly glorifying the wisdom of God. Instances of this device occur in this very chapter. "Who goeth about to kill Thee?" says the ignorant multitude (vii. 20), at the very time when the arrest of Jesus is being planned by the Pharisees: "Out of Galilee ariseth no prophet," say the learned students of the law (vii. 52), so blinded by their malignity that they cannot even read the books that describe the birthplaces of Elijah and Jonah; "We have found Him of whom Moses in the law, and the prophets, did write, Jesus of Nazareth, the son of Joseph," says Philip, happy in the completeness of his new-fledged knowledge (i. 45), and ignorant that a time will come when he will hear from "the son of Joseph" this humiliating rebuke, "Have I been with you so long, and hast thou not known Me, Philip?"

The doctrine of light.

Passing over the story of the woman taken in adultery as being an interpolation, we are led to that section of the Gospel which treats of the doctrine of light. The mention of the Father and the Son, as being two witnesses, bearing witness to the Son—according to the saying of "your law" that "the testimony of two men is true" (viii. 12-17)—is a subtle use of the words of Scripture, such as we look for vainly in the teaching of Christ as preserved by the synoptists.<sup>1</sup> But the connexion between the light and the truth, and between truth and freedom, and the dialogue that follows upon the genuine children of Abraham, remind us, in part, of the synoptic version of the Baptist's teaching about the children of Abraham (Mat. iii. 8; Lu. iii. 8); in part, of the teaching of St Paul concerning the freedom of "Jerusalem which is above" (Gal. iv. 26; and compare Rom. vi. 16-20).<sup>2</sup>

The climax of hatred and insult of the Jews is most appropriately expressed (viii. 48), "Say we not well that Thou art a Samaritan and hast a devil?" and it is also appropriate to a discourse on "the Light that lighteth every man coming into the world" that the Jews should be informed that even Abraham saw that light and rejoiced. It is probable

that both here and in xii. 36 we ought (in spite of the LXX. usage) to translate ἐκρύβη "was hid" (cf. Lu. xix. 42; Heb. xi. 23), and that we must suppose the intervention of some supernatural agency in a judicial retribution hiding the Light from the children of darkness who seek to destroy it.

The section on light terminates with an appropriate sign, The opening of the eyes of the blind man, who is sent to wash his eyes in the waters of a pool named Siloam. The evangelist sees a mysterious meaning in the name of the pool. As the Baptist had baptized in Ænon near to Salim, i.e., the "waters" near to and preparing the way for "peace"; and the Samaritan woman had boasted of her well of Sychar or drunkenness, and the impotent man had been healed in Bethesda or the "house of mercy," so now the opening of the eyes of the blind man is effected in part by the direct action of the Light of the world, but in part also by the instrumentality of water at a pool named "Sent,"—a word which may apply to an aqueduct, "missio aquarum," or to Him whom the Jews expected as the "Sent," i.e., the Messiah. The conclusion of the section on light (ix. 39), "For judgment I am come into this world; that they which see not might see, and that they which see might be made blind," accords with the passage in Matthew and Luke where Christ acknowledges to the Father that it hath seemed good to Him to reveal these things to babes and to hide them from the wise and prudent (Mat. xi. 25; Lu. x. 21); and the climax appropriately introduces the Pharisees, confident in the "lamp of the law," asking, in a tone which suggests the utter impossibility of an affirmative answer, "Are we blind also?" The answer of Jesus distinguishes two kinds of darkness in the soul—the involuntary darkness arising from inexperience of the light, and the voluntary darkness which arises from experience and rejection of the light. His answer explains the sense in which the word "hypocrite" was so often applied to the Pharisees by Jesus in the synoptists. The Pharisees were in darkness, and, like all other men, had received gleams from "the light which lighteth every man," convicting them of their darkness, and leading them to say, "We see not," if they had but been honest. But they persisted in saying, "We see."<sup>3</sup> Therefore, it is said to them, "Your sin remaineth" (ix. 41). These latter words, whether uttered or not by Jesus in the exact shape in which the Fourth Gospel gives them, are undoubtedly true to the spirit of His teaching; and they furnish a suitable end to the discourses on light, bringing prominently forward that "reproving" or "convincing" power of light which is one of the special attributes of that Holy Spirit to whom, step by step, the Fourth Gospel is leading us.

The metaphor of the good shepherd suggests an important difference between the Fourth Gospel and the Gospels of Matthew and Luke, viz., the absence of all allegory and almost all parable in the former. Why did the author, who rejected so many other parabolic subjects, retain only this parable of the shepherd in common with them? The answer may be, partly that it is a parable based upon the teaching of Philo, who distinguishes between mere indulgent "keepers of sheep" and "shepherds," somewhat in the same way in which our parable distinguishes between "hirelings" and shepherds; and he adds that the Supreme Shepherd is God, who orders all His flock of created things through the Logos, His first-born Son (*Plantatio*, &c., 11). In part, perhaps, the author may have

The good shepherd.

<sup>1</sup> It appears to mean the Son, on the one side, manifesting Himself by ἔργα, and the Father, on the other side, abiding in the heart of the hearer, and influencing the conscience to acknowledge and believe in the Son.

<sup>2</sup> Ver. 35 and 36 seem difficult to connect with ver. 34, "*Whosoever committeth sin is the servant of sin*. And the servant abideth (μένει) not in the house for ever, but the Son abideth ever; if the Son therefore shall make you free, ye shall be free indeed." The italicized words seem to confuse the thought. The argument that seems required is this. "No mere servant, such as Moses, is a safe patron for those slaves who desire the master of the house to enfranchise them; the safe patron is the Son, whose influence in the house is permanent." Just such an argument is found in the Epistle to the Hebrews (iii. 5; viii. 3). "Moses was faithful in all His house as a servant, . . . but Christ as a son over His own house, whose house are we;" and in the same epistle Christ is said to "abide" (μένειν) a priest continually, and to be able (Heb. vii. 24, 25) to save men to the uttermost, because He "abideth" (διὰ τὸ μένειν αὐτὸν εἰς τὸν αἰῶνα). It seems probable, therefore, that some early teaching of the church is here confused by the addition of the italicized words.

<sup>3</sup> Philo (as well as the author of the Epistle to the Hebrews) emphasizes the fact that Melchisedek, the true High Priest, the giver of wine instead of water, is the King of Salim or peace (*Alleg.*, iii. 25).

<sup>4</sup> Cf. Philo, *Who is the Heir?* 15, "Look up, so as to convict (ἐλέγχειν) the blind race of common men, which, though seeming to see, is blinded."

felt that the synoptic picture of the shepherd "leaving the ninety and nine sheep in the wilderness" while He seeks the single wanderer, requires at least to be supplemented by the picture of Him who putteth forth His sheep, and is followed by them, so that none of them wander. But a principal reason for introducing this parable at the conclusion of the doctrine of light, and before the narration of the death of Christ, is to prepare the way for that death, by exhibiting the reason for it in a clear light. It is true that Jesus has, before now, predicted that He is to be "lifted up" (iii. 14, viii. 28) and slain (vii. 19, viii. 40); but it needs to be distinctly stated that Jesus will not only be slain, but voluntarily slain; and the motive requires to be expressed. This is explained in the synoptists by saying that He came to give His life as a ransom (λύτρον) for many (Mat. xx. 28; Mk. x. 45). But to whom was this "ransom" to be paid? To God or to the evil one? The question was a difficult one to answer; and the Fourth Gospel avoids, though it does not solve, an insoluble difficulty by substituting a new metaphor for that of ransom: "I am the Good Shepherd. The Good Shepherd giveth His life for the sheep." Then, in a master-piece of delicate spiritual subtlety, while the expression "the Good Shepherd will even be slain by the wolf for the sheep's sake"—which would have introduced all sorts of intricate difficulties—is avoided, the same thing is, by antithesis, indirectly suggested—"But the hireling seeth the wolf coming, and leaveth the sheep, and fleeth." A repetition of this statement leads to a more emphatic reiteration that the Shepherd will lay down His life of His own free will (the essence of sacrifice), "in order that He may take it again" (x. 17)—thus entirely neutralizing the suspicion (so carefully avoided above) that the Good Shepherd may be doomed to succumb to the wolf.<sup>1</sup>

Two points remain to be considered in this chapter (x.). The words, "All that ever came before Me are thieves and robbers," have naturally caused some difficulty; but it is possible that some words, such as "in comparison with Me," are to be understood; and if the meaning was, "all previous redeemers of mankind have been, in comparison with the true Redeemer, self-interested and ambitious," then, such language becomes compatible with the author's point of view; and, even looked at from the synoptic side, it presents little more difficulty than the saying that John the Baptist, though the greatest of the prophets, was less than the least in the kingdom of God.<sup>2</sup> But the second point is of more importance. In defending Himself (x. 35) against the charge of making Himself God, Jesus is made by the author to argue that, if the judges of Israel in the Psalms are addressed as, in a certain sense, divine and gods—"I have said ye are gods,"—*a fortiori* might He Himself without blasphemy call Himself the Son of God. But, if this argument might be adopted, then it might be urged that the Son of God differed from other sons of God only in degree, or, if in anything else, only in pre-existence, and the special privilege of pre-existence has been already destroyed by the evangelist; for, in the introduction to the healing of the blind man, he has caused the disciples of Jesus to take for granted, and Jesus not to impugn, the doctrine that all men exist before birth: "Master, who

did sin, this man or his parents, that he was born blind? Jesus answered, Neither this man nor his parents; but that the works of God should be made manifest in him" (ix. 2, 3). But if all men pre-exist, and if to all men, in a certain sense, may be addressed the title of "God," it would follow that even the Eternal Son of God, by whom the world was made, would be but the eldest among many brethren. It is scarcely possible that the evangelist intended his readers to follow out this train of thought; but it is unquestionable that in spite of the readiness to admit supernatural incidents, the author's habit of referring all phenomena to the action of certain elements—water, spirit, light, darkness, flesh, blood, and the rest—leads him (perhaps unconsciously) into a habit of describing and perhaps even conceiving the life and work of Christ Himself as conforming itself to an unalterable law, which is none the less a law, because it is also a will, the will of our Father. The works that He does are "prepared by the Father." His sheep hear Him; those that are not His sheep do not hear Him. The same thought is expressed, whether the law be regarded as the fixed order of things or as the will of the Father: "No man can come unto Me except the Father which has sent Me draw him."

Again and again He disclaims caprice, and even the exercise of an independent will: "I came down from heaven not to do Mine own will but the will of Him that sent Me" (vi. 38). Though judgment is committed to Him by the Father, yet so rigidly is His power and desire to judge restrained by facts or laws (or by whatever other name the truth may be called), that He solemnly declares that *He* does not really judge, it is the *facts* that judge. "I do not judge," He says (xii. 47), but "the word that I have spoken shall judge him;" and even where He accepts the task of judging, He declares that He judges "as He hears" (v. 30), and "with the Father that sent Him" (viii. 16), *i.e.*, according to truth. The same conception of the work of the Word as being (like the working of the elements) universal, continuous (v. 17), and according to law, is expressed both in the prologue to the Gospel (John i. 1-9), and in the Epistle also, where the writer declares that the commandment which he gives to the church from Christ is "no new commandment," but an old commandment which men had had "from the beginning."

We come now to the last of the pre-resurrection "signs" of the Jesus—the raising of Lazarus. Even those who maintain the historical accuracy of every detail of this narrative will scarcely deny that its symbolic meaning goes down, and is intended to go down, to an act far deeper and far vaster than the revivification of the brother of Mary and Martha. Remembering the teaching of Paul (1 Cor. xv. 45) that there are two men,—the former the "living soul" or fleshly animal nature (ψυχὴ ζῶσα), the latter the "quickenings or life-giving spirit" (πνεῦμα ζωοποιούν); the former the first Adam, the latter the second Adam—we see at once in this miracle the second Adam raising up the first Adam from spiritual death, by imparting to him His own life. The very word used by Paul to describe the second Adam (ζωοποιεῖν) is used by our author to describe the prerogative of the Son—"the Son quickeneth (ζωοποιεῖ) whom He will" (v. 21). Other meanings may, no doubt, be conveyed beneath this central incident of the Fourth Gospel; nor is it impossible that the author, before describing how the Saviour laid down His life for mankind, wished to give the best possible proof of the spontaneity of the action (asseverated above, x. 17, 18) by showing that He was actually the source of life to others. As a preparation for His resurrection on the third day, what could be better than that He should raise from the dead one who had been four days lying in the grave? If, also, a preparation was needed for the doctrine of the Spirit, which is soon to come before

<sup>1</sup> The use of ὑψοῦν ("exalt") to denote what the synoptists (Mat. xx. 19; xxvi. 2; Lu. xxiv. 7) denoted by σταυροῦν ("crucify") is very remarkable. In the synoptists, ὑψοῦν always means "to honour highly" ("every one that exalteth himself shall be abased" (Mat. xxiii. 12; Lu. xiv. 11); but, in the Fourth Gospel, Jesus uses it in addressing (viii. 28) His future murderers, "When ye exalt (ὑψώσθε) the Son of Man": comp. viii. 40, "Ye seek to slay Me." Strictly speaking, of course, we must say that ὑψοῦν is not the σταυροῦν, but the result of it.

<sup>2</sup> Compare Philo, *Abraham*, 44, where a similar contrast is drawn between the distinctive "kingdoms" of human rulers and the beneficent "kingdom" of the ideal man.

us, the resurrection of Lazarus would serve this purpose too. For the Spirit is the source of life (*ζωτικώτατον*, Philo calls it, *Creation*, 7); and, therefore, just as the doctrine of the living water is preceded by the miracle of the water changed into wine, and the doctrine of bread by the miracle of bread, and the doctrine of the supersession of the intermittent sabbath by the continuous loving activity of the Father and the Son (v. 17) is preceded by the miracle of sabbath-healing vouchsafed to the man to whom the intermittent spring was useless, and the doctrine of the Light of the world is preceded by the miracle of giving light to the blind, so is it natural, and, as it were, proportionate, that the doctrine of the quickening Spirit (*cf.* vi. 63, *τὸ πνεῦμά ἐστι τὸ ζωοποιεῖν*) should be preceded by some miracle of quickening the dead.<sup>1</sup>

The doctrine of the Spirit.

The anointing and the triumphal entry into Jerusalem having been discussed above, we pass to the last discourses (xii. 20 to xvii. 26). The last discourses in the synoptists treat of the second coming of Jesus in the clouds of heaven, and of the day of judgment; the last discourses in the Fourth Gospel treat rather of the continuous and increased presence of Jesus in the hearts of the disciples, of the re-proving or judgment of the world by the Holy Spirit, and generally of the function of the Spirit in the church. In other words, the Fourth Gospel exhibits in a spiritualized form that which the synoptists set forth through material imagery. The promise of the future presence of Christ had been expressed by the synoptists in the legacy of His body and blood, which Christ is described as bequeathing to His disciples. The Fourth Gospel, which omits this incident (possibly as being already sufficiently known and receiving sufficient attention), lays more stress on the presence of the Spirit as Christ's substitute. It is important to observe that both the synoptic account of the last supper, and the last discourses in the Fourth Gospel, are founded on one and the same basis of historical fact, viz., that Christ approached death with the expressed conviction that His work would not be frustrated by it, but that He would remain for ever a living power in the hearts of His disciples. There is also, even in the Gospel of St Mark, an intimation that His disciples were to be aided by a "Holy Spirit," which should speak for them before princes and kings: "And when they lead you away, betraying you, take no forethought what ye shall speak, neither rehearse it; but whatsoever shall be given to you in that hour, this speak: for it is not ye that speak, but the *Holy Spirit*" (Mk. xiii. 11). To the same effect Jesus speaks in the parallel passage of Luke (xxi. 14, 15), bidding His disciples not to rehearse their defence (*προμελεῖν ἀπολογηθῆναι*), for He will give them "a mouth and wisdom," which their adversaries shall not be able to gainsay. Thus, even from our earliest Gospel, it would seem that to those unlettered Galilean peasants, diffident (as Moses had been before them) of the sufficiency of their rhetoric to plead their cause before the bar of the great ones of the earth, a promise had been made of a "mouth" that should plead for them. The Holy Spirit was to be their Advocate. It is not likely that Jesus should have uttered these two expressions (quoted above) and no more, about the Spirit which was to be His substitute. Therefore, if the author of the Fourth Gospel had access to any apostolic sayings and

traditions that illustrated the teaching of Christ during the last two or three days before His death, we might naturally expect to find in these traditions something more about the Spirit which was to be the Advocate of the disciples when pleading without their Master before the sanhedrin, and before princes and kings. Accordingly, finding in the last discourses of the Fourth Gospel an ampler doctrine on this subject, we have no ground, *a priori*, for regarding it with suspicion. True, the doctrine is set forth here, as elsewhere, in the peculiar language of the writer, so that we are absolutely certain that we have not the exact words uttered by Jesus; but this need not hinder us from accepting the thoughts as the thoughts of Jesus, if we can throughout trace the synoptic doctrine. In the synoptists Jesus predicts that He will "rise again"; obviously the letter of this prediction, though important, implies a still more important spiritual meaning beneath it. For this prediction would not have been satisfied by any amount of literal fulfilment if Jesus had merely walked from His grave and exhibited Himself alive, by tangible as well as ocular proof, to thousands of curious observers, hostile as well as friendly, unless He had at the same time poured a new influence or influent spirit into the hearts of those to whom He manifested Himself. It is characteristic of our evangelist that he realized (1) that the essence of the resurrection of Christ consists in His spiritual resurrection and intensified presence in the hearts of His disciples; (2) that this resurrection, triumphing over death, and making death the stepping-stone to a more active life, is as much in accordance with law, as is the growth of the corn of wheat which (xii. 24), "except it fall into the ground and die, abideth alone; but if it die, it bringeth forth much fruit." This law—illustrated daily by the increased influence of the dead upon the living, no less than by the fruitful death of the "corn of wheat"—a law so simple and yet so profound, like all the other laws enunciated by Jesus, can hardly have proceeded from any other than from Jesus Himself. The spiritual depth of the doctrine, and the similarity which it bears to the synoptic prediction (in spite of the difference of outward form), furnish strong arguments that, in the last discourses of the Fourth Gospel, we have much of our Lord's own teaching, though modified by the medium through which it is conveyed to us.

The doctrine of the Spirit, regarded not now as the purifying element in conjunction with water, but as the Advocate or Paraclete—being the highest and most esoteric doctrine of all—is reserved for the inner circle of His disciples. First, therefore, it is necessary to bring to an end the doctrine of Jesus to the outside world; and the battle between light and darkness, between Jesus and the Pharisees, ends with a recapitulation and conclusion of the doctrine of light. The Gentile world, appearing on the stage in the person of some inquiring Greeks, stretches out her hand to the Messiah (xii. 20); a voice from heaven attests His glory (xii. 28). The Son of God pronounces the fall of the evil one, and, almost in the same word, His own victorious death (xii. 31, 32). Then the light is hidden from the rebellious nation (xii. 36); the evangelist pronounces against them the sentence of condemnation, that they are blinded because they loved darkness more than light, and the praise of men more than the praise of God; and for the last time the voice of Jesus is heard, as it were from behind a cloud, warning those whom He has left in darkness that in rejecting Him they have rejected the Father also (xii. 37–50).

The esoteric doctrine begins with a parable of action, in which the Lord, by washing the feet of His disciples, teaches them humility. Two classes of heretics seem aimed at in this parable,—those who reject the washing of Jesus, to whom Jesus replies, "If I wash thee not, thou

<sup>1</sup> The complete discussion of this, the crowning "sign" in the Fourth Gospel, is not adapted for these pages. It would require a close examination of Lu. xvi. 20–31, together with Lightfoot's (*Horæ Hebraicæ*) comment on "Lazarus." On this point see also Wunsche, *Neue Beiträge zur Erläuterung der Evangelien*, p. 467; and compare Philo on the meaning of Eliezer (Lazarus) in *Who is the Heir?* 11, 12. The greater part of Origen's commentary on this portion of the Fourth Gospel has unfortunately perished; but some light may be thrown on it by a study of his *Comm. in Ev. Joann.*, xxviii. 5, 6, 9, as well as by Augustine, *In Joann. Evang. Tract.*, 49. The reasons usually alleged for the omission of this "sign" by the synoptists would also require careful consideration.

hast no part with Me ;” and those who laid stress on repeated baptisms or purifications, “He that is (wholly) washed (λελουμένος) needeth not save to wash (νίπτειν) his feet.” Now Judas, the child of darkness, goes forth from the chamber, and the evangelist seizes the moment to tell us that “it was night” (xiii. 30). Yet in this hour of darkness the hour of glorification is hailed by Jesus ; and He conveys to His disciples, not indeed a new testament, but a new commandment, “that ye love one another” (ver. 34). How could this be called a new commandment for those who had been commanded long ago by Jesus to love even their enemies, much more their friends ? The answer is found in the context : “As I have loved you, that ye also love one another,” the meaning being, that after the death of Jesus, the memory of His love, enhanced in His absence, would spring up as an entirely new power within their hearts, so that “love” would assume a new meaning, and the command to love—though as old as the first influence of the Word, and therefore as the creation of man—would become essentially a new commandment. These words occur almost verbatim in the First Epistle of John (ii. 7), and, from their language, they can hardly be accepted as giving the letter of the words of Jesus ; but they go down to the very roots of His teaching. The importance here attached to this new commandment of love leads us to observe that, throughout the whole of these discourses, love, almost as much as the Spirit, occupies the thoughts ; and, indeed, in chapters xiii., xiv., xv., and xvii.,<sup>1</sup> the word ἀγαπᾶν occurs 24 times, against 10 times in all the rest of the Gospel. The connexion is obvious : step by step we are being led up to God ; and God is love. The doctrine of the Spirit can reveal no higher manifestation of Him than this ; and the Spirit itself is a Spirit of love, which will find its home only in the hearts of those that love.

Although Jesus has not expressly predicted His death, yet the warnings of betrayal and departure have troubled the hearts of His disciples. To comfort them Jesus promises that He will return, and be still present with them. But neither is the path of His departure and return, nor is His presence itself—so He warns Thomas and Philip—to be regarded as material. He will (spiritually) be more present with them, when, and because, He will be (materially) absent. Greater works will they do than He has done, because He, abiding with the Father above, will lift up their hearts to heaven—their home henceforth because their treasure, Christ, is there—and will make them one with Himself and with the Father, in will and in power. And here is repeated the saying, also found in the synoptists, that whatsoever the disciples pray for they shall obtain,—joined with the assurance that they shall do greater works (ἔργα) than He Himself does (xiv. 12). Note here that our evangelist brings out more clearly than the synoptists the spiritual meaning of the promise concerning prayer, and makes it evident that, as above, the works (ἔργα) meant are not “miracles” (δυνάμεις),—not the casting of a material mountain into the sea, as might be inferred from a misinterpretation of the synoptists,—but the Messianic “works” of forgiveness and regeneration.

The nature of Christ’s future presence in the hearts of His disciples is differently described in different passages. At one time (xiv. 30) He declares that He Himself, together with the Father, will take up His abode in every heart that loves Him ; but more often He uses the word used by Mark above, and speaks of a *Spirit* which shall be sent to them by the Father. He applies to the Spirit the very title we have been led to apply to the Spirit as described by Mark—the Advocate (Παράκλητος, or Advocatus). As a paracletus or advocatus was wont to explain the law to Greek or

Roman clients, and to put words into their mouths, or rather to be himself their spokesman, so the spiritual Paraclete or Advocate would not only put words into the mouths of the disciples when they stood before the bar of kings (Mk. xiii. 11), but would also teach them all things, and bring to their remembrance all the spiritual laws laid down by their lawgiver Christ (xiv. 26). In one sense, the Spirit is a witness, because He testifies of Christ (xv. 26) ; but even here He is in reality an advocate, for the testimony is regarded as not uttered by the Spirit directly, but indirectly through the mouths of the inspired disciples who are to be “martyrs” or witnesses (μάρτυρες) for Christ (xv. 27). It was very natural that that aspect of the advocate’s work which most impressed the editor of our earliest Gospel should retire into the background when the first brunt of the collision between the church and the world was over ; and that gradually the work of the advocate should assume a wider province than that of merely educating the disciples to plead the cause of Christ in the presence of Gentile judges. Hence Paul regards the Spirit as teaching the disciples not so much what to say in their defence before earthly kings as rather in their prayers before the King of Kings : “We know not what we should pray for as we ought : but the Spirit itself maketh intercession for us with groanings which cannot be uttered” (Rom. viii. 26) ; “The Spirit searcheth all things, yea, the deep things of God, . . . which things also we speak, not in the words which man’s wisdom teacheth, but which the Holy Spirit teacheth” (1 Cor. ii. 10–13). But this conception, carried a stage further, makes the paraclete an advocate not revealing the laws of the celestial kingdom to the enfranchised citizen of it, nor yet revealing the will of the Father in heaven to the child on earth, but rather pleading the cause of the child before the offended Father ; and in this sense Philo seems to use the word when he describes the high priest as clothed in the garb which is typical of the invisible universe, i.e., typical of the Logos or Son of the Supreme Father of the world—because it was necessary for the priest consecrated to the Father of the world that he should have as his paraclete the Son, in order (through Him) to obtain pardon of sins and supply of blessings (*Life of Moses*, 14) ; and he also introduces Joseph (ch. 40) saying to his brethren, “I forgive you ; seek no other *paraclete*,” i.e., no one to act between me and you as your advocate ; and lastly, in this sense, the First Epistle of John (i. 1, 2) seems to use the word in the passage, “If any man sin, we have an advocate with the Father, Jesus Christ the righteous ; and He is the propitiation for our sins.”<sup>2</sup> But though our evangelist uses the word in this somewhat lower sense in the Epistle, in the Gospel he nowhere uses it thus. There the Paraclete’s function is to be, as in Luke, “a mouth, a wisdom” (Lu. xxi. 15) ; to be a substitute for the helping presence of Christ (xiv. 16) ; to teach and remind (xiv. 26) ; to testify and to aid the disciple to testify (xv. 26) ; and to convict the world of sin (xvi. 8) ;—but nowhere to obtain forgiveness of sins from the Father by pleading the cause of the disciples in His presence. It is not an unreasonable inference that the evangelist’s different use of this word in the Gospel and the Epistle may have arisen from the fact that in the former he is adhering more closely to the original use of it as handed down by Christ Himself.

Besides describing the work of the Paraclete as a consequence of the departure of the Son to the Father, the discourse touches upon the enmity which the disciples must be prepared to meet, and enforces the necessity of unity

<sup>1</sup> Note the curious break in chapter xvi., where the word ἀγαπᾶν does not occur at all, and φιλεῖν is twice used, xvi. 27.

<sup>2</sup> Cf. Schoettgen, vol. ii. p. 659, where it is shown that the Jews adopted the Greek word *συνηγορος* (not in its classical sense of “prosecutor,” but in the sense of “advocate for the defence”), under the form מְדַבֵּר, and applied it to Michael, who defends Israel from the accusations brought against him in the presence of God.

through love. Only in two points does the thought seem to suggest the influence of Philo; and in both of these Philo is rather corrected than followed. Philo says (*Giants*, 7) that it is impossible that the Spirit of God should remain for ever in the soul (though it may for a time) because of our inseparable connexion with the flesh; he adds (in language which is at least liable to the interpretation of asceticism) that, as Moses fixed his tent outside the camp, so those who would have the Divine Spirit as a permanent tenant of their souls must put off all the things of creation; the safest course being to contemplate God, not even through the uttered word, but without utterance, as absolute, indivisible existence (*ib.* 11, 12); with the mass of mankind the Spirit remains only for a moment, nor would it ever have visited them but to convict (*διελέγξαι*) them of choosing what is disgraceful instead of what is good (*ib.* 5).<sup>1</sup> The Fourth Gospel emphasizes no less the work of the Spirit in "convicting" (*ἐλέγχειν*) the world of sin; but it is also careful to say that the gift of the Spirit shall be permanent, "not as the world giveth give I unto you" (*xiv.* 27), and that the disciples are to remain in Jesus, while nevertheless not taken out of the world (*xvii.* 15). The Saviour is no more in the world, and the disciples are in the world (*xvii.* 11); yet He will not pray that they should be removed from the world, but only that they should be delivered from the evil (*ver.* 15). The discourse concludes with the prayer that all future believers may be knit together into one great body, which shall be in the Father and the Son, while at the same time the Father and the Son are in it (*ver.* 21, 23); and the last words of all, after innumerable periphrastic metaphors to describe the promised presence of Christ with His disciples, recur at last to the plain expression of His presence, "and I in you"—not greatly differing from the promise in the First Gospel (*Mat.* xxviii. 20), "I am with you always."<sup>2</sup>

There is doubtless a purpose in this accumulation of obviously inconsistent statements of the local relations between the Father, the Son, the Spirit, and the Church: "I am in the Father, and the Father in Me;" "Ye in Me, and I in you;" "I go unto the Father;" "The Holy Spirit whom the Father will send in My name;" "The Comforter whom I will send unto you from the Father;" "I came forth from the Father, and am come into the world;"—the intention being to prevent the mind of the reader from attaching any importance to mere local relations between the Three Persons, and to force him to form spiritual conceptions instead of local by showing that the most opposite local relations may be simultaneously predicated. Thus contradiction after contradiction leads the reader at last to pierce beneath the literal integuments to the spiritual truth concealed below them; and, aided by the bold analogy (*xvii.* 21) derived from human unity ("that they all may be one; as Thou, Father, art in Me, and I in Thee, that they also may be one in us"), we are led at last to discern that the unity is not that of place,

but of will; and that the bond of unity is not sight working through material presence in material light, but Love working through spiritual sight or the spirit of truth, independently of material presence. And so, after all, the evangelist leads his reader to see that the coming of the Paraclete (like all things else in his Gospel) is according to law; "If I go not away, the Comforter will not come unto you" (*xvi.* 7); "The Holy Spirit was not yet given, because that Jesus was not yet glorified" (*vii.* 39). Not until the dead has passed away from us does the "idea of his life" creep into our minds—

"Apparelled in more precious habit,  
More moving-delicate and full of life  
Than when He lived indeed;"

and the Eternal Word, who subjected Himself to the laws of human nature in birth and life, may be supposed without irreverence to have subjected Himself to, or perhaps rather we should say to have availed Himself of, the same laws of human nature which regulate God's ordinance of death.

The crucifixion having been considered above, we pass The to the narrative of the resurrection. Matthew and Mark resurrection. imply that Jesus manifested Himself to the disciples in Galilee; Luke mentions none but manifestations in Judæa; the Fourth Gospel mentions manifestations in both places. Compared with Matthew and Luke, the Fourth Gospel may be said to handle the subject more familiarly, taking the resurrection, so to speak, more as a matter of course, and representing Jesus as moving in a more human fashion among His disciples after He had risen from the grave, helping them in their fishing, holding long conversations with them, and, in a word, renewing almost without a break the intercourse of the days before the crucifixion. In Matthew, the Christ after death appears once, upon a mountain, doubtfully discerned by some, and emits one final message, sending His disciples to evangelize the world, and promising them His perpetual presence. In Luke the risen Christ "vanishes," causes fear and terror to His disciples, and is supposed to be a "spirit" till He eats food in their presence; finally He is "parted from them." In John, the ascension, though alluded to, is not described; and everything else that might give the manifestation a phantasmal character is studiously kept in the background. No mention is made of the angel who descends (*Mat.* xxviii. 2) from heaven to roll away the stone from the sepulchre, terrifying the keepers of the grave, and bidding the women "fear not." It is rather assumed that, by His own unaided strength, Christ burst the bars of the grave, and after leisurely laying aside the grave-clothes, and the "napkin in a place by itself" (*John* xx. 7), went forth to converse with His disciples. It is true that the Fourth Gospel does not attempt to conceal the fact that the manifestations of Jesus were more than once not recognized by His disciples at first; but, in the cases of non-recognition, it is suggested (as in Luke), not that the manifestation was faint or shadowy (as seemingly in *Mat.* xxviii. 17, "And when they saw Him, they worshipped Him; but some doubted"), but that they mistook Him for a stranger (*xx.* 14; *xxi.* 4). That Jesus ate in the presence of His disciples is not stated, nor can it be said to be implied; but His familiar presence at the meal of the disciples (*xxi.* 13) suggests a real presence almost as effectively as the narrative of the eating of the fish and honeycomb in Luke. Additional conviction is also obtained by taking one of the apostles, Thomas, as a type of resolute scepticism, refusing to believe unless he touches the body of the risen Saviour, and by describing how even such scepticism as this was converted into certainty. Moreover, as the water and the blood were visibly given by Jesus on the cross, so—lest the giving up of the breath on the cross should be a scarcely sufficiently noticeable type of the gift of the holy breath or Spirit—

<sup>1</sup> Comp. Philo, *Quod Deus Immutabilis*, 26: "When the high priest, conviction, like a pure ray of light," flashes on our minds, we realize our pollution; and thus conviction may be said, as it were, to pollute our former imaginary and self-satisfied righteousness.

<sup>2</sup> There is an attractive symmetry in the supposition of Canon Westcott (*Introd. to St John's Gospel*), that these discourses (*xiii.*, *xv.*, *xv.*), in which alone is any mention made of "commandments," are intended to be a kind of Sermon in the Chamber, corresponding to the Sermon on the Mount. The Sermon on the Mount sets forth the new law of Christ; the Sermon in the Chamber vivifies the new law with the new Spirit. This supposition exactly corresponds with the "spiritual" (Muratorian fragment) motive of the Gospel; and the esoteric nature of the doctrine is not inconsistent with the statements which are said to be mainly "based on direct knowledge of Papias's book" (Westcott, *Canon*, p. 76), that Papias, "a dear disciple of John," wrote five books entitled "exoterica." For "exoterica" imply "esoterica."

our evangelist records that Jesus breathed on His disciples and said, "Receive ye the holy breath" (or Spirit)—at the same time connecting with this highest gift the highest activity for which a human soul can be inspired by God, the faculty of forgiving sins. It is probable that the Gospel originally ended at xx. 31: "But these are written that ye might believe that Jesus is the Christ the Son of God, and that believing ye might have life through His name." This is a most appropriate termination; and what follows bears every appearance of being an appendix added by the author, describing a miraculous draught of 153 fishes, and a meal of Jesus with seven of the disciples, followed by a dialogue between Jesus and Peter, in which the death of the latter is predicted, and the erroneous tradition that the beloved disciple should not die is shown to be baseless.

Three inferences seem probable from this last narrative:—(1) that there had been at Ephesus a tradition (arising perhaps from the extreme old age of John and from some such expression as is recorded in John xxi. 22) that John would not die till the Lord had appeared; (2) that John had died when this account was written (for if he were living and past his ninetieth year, at a time when the church daily expected the coming of the Lord, the Ephesian Christians would not have needed any explanation or softening away of a prediction which would seem to them very likely to be fulfilled); but (3) if John was dead, it must seem that the words "we know" *could* not have been added (as they might be supposed to have been added, according to the Muratorian legend) by Andrew and Philip, who in all probability died before John died; and if John was dead, it must seem that the words *would* not have been added by any elders of Ephesus representing the generation after John; for how could they—who stood on a footing altogether subordinate and inferior in point of reputation, and with no opportunities of information—have ventured to ratify the testimony of the "beloved disciple?"

Author-  
ship of  
Fourth  
Gospel.

It is more easy to arrive at negative than at positive results, when evidence is so slight; but it seems probable that the author, attempting to give the spiritual essence of the gospel of Christ, as a gospel of love, and assigning the Ephesian Gospel to the beloved disciple who had presided over the Ephesian church, by way of honour and respect (for the same reasons which induced the author of the 2d Epistle of Peter to assign that Epistle to the leading apostle), and being at the same time conscious that the book (though representing the Ephesian doctrine generally, and in part the traditions of John the apostle, as well as those of Andrew, Philip, Aristion, and John the elder) did not represent the exact words and teaching of the disciple—added the words "We know, &c.," partly as a kind of *imprimatur* of Andrew, Philip, and the rest; partly in order to imply that other traditions besides those of John are set forth in the book; partly to characterize the book as a Gospel of broader basis and greater authority than the less spiritual traditions issuing from non-apostolic authors, which our evangelist desired to correct or supplement. Nor is it in the least unlikely that this Gospel does represent the teaching of Andrew and Philip, and Aristion and John the elder, as well as that of John. If Papias of Hierapolis gathered up the traditions of these apostles and elders, why not also our author, writing in Ephesus perhaps several years before Papias? It is assuredly not for nothing that the name of "Matthew," mentioned in Matthew, Mark, and Luke, is not found in the Fourth Gospel; nor is it without significance that the Gospel begins and ends with an inner apostolic circle. The "twelve" are indeed mentioned, but as in the background. The beloved disciple, Andrew and Peter, Philip and Nathanael,—these, and these only, are mentioned as called by Jesus in the beginning; Peter and

Thomas, Nathanael and the sons of Zebedee, and two other disciples (presumably the same list as those above, with the addition of James, the son of Zebedee, and Thomas), are mentioned as alone admitted to the sacred meal which closes the Gospel. This fact marks the whole character of the book; it is esoteric and eclectic, and designedly modifies the impression produced by the tradition previously recorded by the synoptics.

*The criticism of the first three Gospels.*—For fourteen centuries the church was content to follow Augustine (*De Consensu Evangelistarum*, i. 4) in believing that Mark was "as it were the humble companion (*pedissequus*) and abridger" of Matthew. Towards the end of the 18th century this dogma was shaken, and two different hypotheses were put forward: (1) that the evangelists had borrowed from one another, either Matthew from Mark, or Mark from Luke, or even (so capricious and baseless were the hypotheses which now started into existence) Matthew and Mark from Luke; (2) that all the three Gospels depended upon an original and common Gospel. The first of these hypotheses may for convenience be called the "borrowing" hypothesis; the second may be called the "traditional" hypothesis. Eichhorn was the first to systematize the "traditional" hypothesis, maintaining (1794) that the original tradition was a written Aramaic Gospel, known to the three synoptists, but afterwards (1804) so far modifying his views as to recognize that the Aramaic tradition had been translated into Greek, and passed through several documentary stages, before it assumed the form preserved in the triple version of our synoptists.

Inside the circle of those who maintained the traditional hypothesis there now arose inner divisions upon the question, which evangelist most closely approximated to the "original" tradition. Eichhorn had assigned (1804) the priority to Matthew, Gratz (1812) to Mark. Moreover, a new form of the hypothesis was shaped out by Schleiermacher (1817), who maintained that our Gospels were composed on the basis of a number of disconnected documents; while Gieseler (1818) showed that it must have been, in any case, oral tradition which served the needs of the earliest disciples,—tradition stereotyped by time, and reduced to some kind of similar pattern before being committed to writing by the synoptists. Still no certain conclusions were arrived at. De Wette (beginning from 1826) assumed a common oral tradition for Matthew and Luke, and treated Mark as an epitomizer. Credner (1836) joined Schleiermacher in tracing our Gospels back to a collection of words of the Lord, which he supposed Matthew to have combined with the oldest Gospel, viz., Mark; similarly Lachmann (1835). Bleek (1862-1866) relapsed into Griesbach's view (1784-1790) that Mark was based on Matthew and Luke.

All these conflicting hypotheses might naturally induce those who had not themselves closely studied the synoptic texts to believe that the truth of the matter was unattainable, and that, in any case, the synoptic narratives (not being the records of eye-witnesses, nor being preserved in unaltered documents written contemporaneously with or soon after the events) must necessarily be untrustworthy. Accordingly, in 1835, Strauss maintained that the whole synoptic narrative was legendary or otherwise untrustworthy. The defenders of the synoptists against Strauss found little consideration, and the hypothesis that Mark contained the original Gospel was discredited by the extravagance of its supporters. In 1846-7 Schwegler and Baur, recurring to the "borrowing hypothesis," issued it in a new form as an "adapting hypothesis." The original Gospel was now supposed to be the Gospel of the Hebrews (see p. 818 above), which was imagined to contain in all its bare truthfulness the Ebionite doctrine of the early church. Matthew combined this original Jewish-minded document with some other document of more liberal sentiments. Luke was at first a Pauline protest against Judaism, but was afterwards supplemented, in a conciliatory spirit, with passages coloured with Ebionitic and Jewish thought; Mark was treated as a neutral and colourless adapter of Matthew and Luke,—"*pedissequus et brevior*." This was the Tübingen doctrine, sometimes called the "tendency hypothesis," because the adaptations were supposed to proceed from theological "tendencies."

Ewald (beginning from 1849) combated the Tübingen theory, maintaining that (1) there was an original Gospel, perhaps composed by the evangelist Philip; (2) in addition to this, there was a collection of "logia" made by Matthew; (3) and, out of both these documents, or by an author acquainted with these documents, was formed Mark, or, at all events, Mark in its original shape; (4) Matthew contains (1) (2) and (3), together with extracts from a "book of higher history"; (5) three anonymous evangelists revived this narrative, which received its last form at the hands of Luke (see the account of Ewald's theory in Westcott's *Gospels*, p. 203). From this time the compilatory and artistic character of Luke began to be generally recognized; and even the Tübingen school gave up the theory that Mark had adapted Luke. Hilgenfeld, "in a five years' literary struggle with Baur" (see Holtzmann, in Schenkel's *Bibel-Lexicon*, art. "Evangelien"), proved Mark's independence. Köstlin (1853)

advocated an original Mark as the groundwork of the synoptists; together with a "Gospel of Peter" as the basis for the parts common to Matthew and Luke. Ritschl (1851), recanting his former opposition, and Meyer (1853) became converted to the belief in an "original Mark." Volkmar (1857) and a number of other theologians took the same view; Weiss (1861) advocated a parity of originality, or rather a common original source, from which Matthew and Mark borrowed equally, while occasionally Matthew borrowed from Mark itself. But the work which most approximates to a proof of the originality of the tradition contained in Mark is Holtzmann's *Die Synoptischen Evangelien*, &c., 1863, from whose summary of the criticism of the first three Gospels (Schenkel's *Bibel-Lexicon*, "Evangelien") these statements are mainly drawn. The author of *Jesus of Nazara*, Dr Keim, of whom, for the sake of that interesting work, we would speak with all respect, was almost alone in defying, in his last work (p. vii. *Aus dem Urchristenthum*, 1878), the "mane-shaking of the Mark lion;" but even he, with qualification (*ib.* p. 30).

The work of Dr Holtzmann last referred to is of great value; and so are Dr Weiss's *Marcusevangelium* (1872) and *Matthäusevangelium* (1876); but it is truly lamentable that nearly a century has passed in the accomplishment of so little. The reason is perhaps to be looked for (1) in the amount of personality which has been introduced into discussions of this kind; (2) in the haste with which theories have been erected upon the basis of single causes; (3) in the general absence of attempt to classify and concentrate evidence; (4) in the failure to recognize the distinction between probabilities and certainties, and the amount of labour necessary to attain certainty; (5) most of all, in the absence of mechanical helps. It is probable that the publication of Bruder's *Concordance* in the middle of this century has done more than all the rest of the hypothesis inventors, from Augustine to Hitzig, to forward the scientific study of the synoptic Gospels, nor could Dr Holtzmann's valuable work have been written but for the humble assistance of Bruder. It is lamentable to think how much industry, ink, and paper, and occasionally intellect as well, might have been saved if there had been in common circulation from the beginning of this century, along with Bruder, a harmony of the Gospels, printed after the manner suggested above (p. 790), from which any one, almost without knowing Greek at all, could have seen at a glance that the "pedissequus" theory of Mark was not for a moment tenable, and that Mark contains—by no means, necessarily, is—the original tradition from which, at least in some places, Matthew and Luke independently borrowed.

There are signs that a similar waste of industry is to be apprehended in the further discussion of the question whether the common tradition is derived from oral or documentary sources. When, for example, we find so able a critic as Dr Holtzmann (Schenkel, "Evangelien," p. 210) laying stress on the irregular form ἀρεκατεσάθη occurring in the same place in all the three synoptists (Mat. xii. 13; Mk. iii. 5; Lu. vi. 10) as a convincing proof that the copying of documents (and not oral tradition) can alone explain so strange a similarity, we naturally suppose that this irregularity is nowhere else found in the Old or New Testament. But so far is this from being the case that the irregular form may be with greater truth said to be the only form current in the Old and New Testament, occurring not only in the three passages above, but also in Mk. viii. 26 (ἀρεκατῆσθ); in Jerem. xxiii. 8; in Exod. iv. 7; in var. interpret. Gen. xxiii. 16 [Trommius quotes 3 (1) Esdr. i. 36 (?33), but Tischendorf reads ἀρετῆσθ]; and the only passage in which the regular form is found, Gen. xl. 21, contains a var. lect. ἀρεκατεσῆσθ, which, no doubt, ought to be inserted in the text. This may serve as an example to show how ultimately circuitous the path must be through these attempted short cuts to certainty. The truth is that the question of oral or documentary sources is not to be settled without a great deal more of labour and of judgment than the subject has hitherto received. For a statement of the oral hypothesis, which is generally adopted by English scholars, the reader is referred to Westcott's *Introduction to the Gospels*, pp. 161–208. It has been pointed out, however, by Dr Sanday (*Academy*, Sept. 21, 1878) that there has been of late an increasing tendency in the three theories—the Tubingen or adaptation theory, the documentary Mark theory, the oral tradition theory—to approximate to each other; so that the tendency theory has given less weight to dogmatic tendencies and more weight to literary considerations. The documentary Mark theory allows the previous influence of tradition, only stipulating for some lost documentary links between the oral tradition and our Mark; while the oral theory approaches to the documentary Mark theory in assuming that the oral Gospel is represented most nearly by our present Mark. Nevertheless, says Dr Sanday, between the two last theories (for the Tubingen theory may be left out of account) "the struggle has yet to come. The division between these is almost national. In Germany no one of any significance as a critic holds the oral theory. In England none of our prominent writers hold anything else. France is divided. Godet ranges himself on the side most popular in England. Réville was an early supporter of a view similar to that which is gaining the ascendancy in Germany; and the same is substantially adopted by M. Renan."

It is greatly to be desired that, in this "struggle," the disputants may illustrate the subject in a somewhat ampler manner than has been hitherto common. Different versions of the same original—tales, histories, ballads—transmitted through documentary and oral sources should be compared together; and more especially the phenomena of the ante-Jerome versions of the New Testament should receive the most careful study, before even the ablest commentator should allow himself to use the dogmatic tone which unfortunately characterizes Dr Weiss's *Matthäusevangelium* in deciding against the oral theory. But this is a natural characteristic of an author who sees in a single Ἱεροσαλήμ convincing proof of an Aramaic original (see p. 805 above), and to whom a καὶ ἰδοὺ settles all critical disputes. With this dogmatism the tone of Canon Westcott's remarks on the oral Gospel contrasts advantageously. Nevertheless, it will probably be hereafter found that the phenomena of our present synoptists are due not to one, but to all, of the causes advocated by the various disputants of the 18th century. Tradition, documents, theological tendencies, literary modifications, misunderstanding of metaphorical parable, misunderstanding of eucharistic language, misunderstanding of spiritual language—all these causes will be found to have contributed to produce the present synoptic result; and it will not improbably be found, as Dr Sanday shrewdly suggests, that early documents have been much more modified, and early oral traditions much less modified, than modern associations might have led us to suppose. Future investigations will receive a considerable stimulus and help, as soon as a harmony of the synoptists showing the Triple Tradition as well as the double traditions (pp. 795–800 above) becomes a recognized text-book for all students of the Gospels. It will also be a useful check, if no demonstration of different documents (in Luke, for example) be recognized as sound until it has been tested by application to other authors. For example, the proof from καὶ, δέ, τε, εἶπε, λέγει, λαλεῖ, Ἱεροσαλήμ, κύριος, ἐνώπιον, εὐθύς, καὶ ἰδοὺ, is by no means to be despised; but it requires expression in a clear picturesque way by the well-known means of curves; and no proof of this kind ought to be accepted until it (or corresponding proof) has been applied,—first (a) negatively, to several passages recognized as genuine productions of the same author (Plato, for example), and then (b), positively, to several passages, some of which are recognized as genuine, others as spurious. In the first case (a) the curves will exhibit no fluctuations; in the second (b) the curves will exhibit fluctuations corresponding to the fluctuations in Luke; and this will be a strong and clearly intelligible proof (even to those who know no Greek—for the same illustrative proof might be deduced from the application of the test to *Titus Andronicus* and to *Hamlet*) that the fluctuations of the curves are caused in each case by the incoming of different documentary strata. But perhaps, to do this thoroughly, it would be necessary to do it four or five times over for each of the four or five principal ancient MSS. (nor ought, perhaps, even varieties of spelling, and certainly not varieties of form, such as ἦλθεν, &c., to be neglected, as possibly pointing to the incoming of different documents); and the labour is so great that, even with the avoidance of all broaching of hasty theories and all personalities, a single worker could hardly accomplish it with the devotion of a life,—at least that is the conclusion to which the present writer has been forced after devoting some years to this labour. Yet, in any case, one signal advantage will result from our keeping before ourselves a high standard of demonstration, viz., that, although we may bring forward theories for discussion, we shall draw a very distinct line between what is proved and not proved, and shall shrink with a just horror from short cuts to knowledge.

*The Criticism of the Fourth Gospel.*—No criticism of a systematic kind, says Dr Holtzmann (Schenkel's *Bibel-Lexicon*), began till the publication of Bretschneider's *Probabilia* (1820), which provoked so much opposition that the author retracted it. The apostolic authorship was supported by Schleiermacher, and by Credner (1836), even while admitting that the Gospel could not be regarded as a purely objective work. Similarly De Wette, after some doubt and hesitation (1837), and Reuss (1840–64) decided for the Johannine authorship,—the former being influenced by a comparison of the Fourth Gospel with the other works of the 2d century. The attack of Strauss, in his *Life of Jesus*, being passed over (as indicating no attempt, or possibly ability, to appreciate the depth of the spiritual doctrine in the Fourth Gospel, in spite of the suggestiveness and occasional accuracy of his method), we come to Baur (1847), who pronounced the Gospel to be a religious ideal poem, composed in the 2d century. A great number of writers accepted this theory; among them, Zeller and Hilgenfeld, and Schenkel and Keim in their lives of Christ, together with Réville (1864) and Scholten. In the meantime an hypothesis of "partial authorship" had been suggested, some (Weisse in 1838, and Freytag in 1861) believing that the discourses, others, as Renan (1863), believing that the historical narratives, were genuine; while some wished to detach the Judæan from the Galilean portior of the Gospel, as being distinct in authorship and origin. Lucke, Ewald, Brückner, and Wittichen, adopting in various forms the view of a divided authorship, recognized in the Gospel a framework of historical fact, but noted also the promi-

Criticism of Fourth Gospel.

nence of the ideal, the want of historical development, and the subjective colouring given by the author to the discourses of Christ—views which find a full expression in Weizsacker's *Untersuchungen über die evangelische Geschichte* (1864). Canon Westcott, in his *Introduction to the Gospels* (5th ed., 1875), maintains apostolic authorship, which is also in a special treatise (*Authorship and Historical Character of the Fourth Gospel*, 1872) maintained by Dr Sanday. The latter work lays perhaps somewhat too much emphasis on the geographical expressions which are used to prove that the author was a Jew of Palestine. Many of these would appear natural for an Alexandrian Jew who had spent two or three passovers at Jerusalem, and had travelled through the country. Still more doubtful is the canon assumed throughout the treatise, that graphic details, particularities of name, place, &c., imply an eye-witness—the contrary being suggested by the phenomena of the apocryphal Gospels. Nor does Dr Sanday make any attempt to illustrate the Fourth Gospel (except in respect of the Logos doctrine) by the teaching of Philo. Nevertheless the book is eminently candid, and there is no other book in English to compare with it for the light it throws, not only on the Fourth Gospel itself, but also on the history of its criticism. Dr Sanday also recognizes, even more fully than Canon Westcott, the subjective nature of the Gospel, at least so far as to

make this admission, that the words of Jesus himself and the words of the evangelist are, in more than one instance, so inextricably intermixed that it is impossible to tell where the former end and the latter begin. In the *Introduction to the Gospel of St John*, published (1879) in the *Speaker's Commentary*, Canon Westcott has greatly amplified the valuable remarks on the Fourth Gospel contained in his *Introduction to the Study of the Gospels*, and states most forcibly the views of those who see in the multiplicity of detail in the Fourth Gospel one among many proofs that the Gospel was composed by an eye-witness of the events which it records. For the doctrine of the Logos Canon Westcott gives the following list:—Gfroerer, *Philo u. d. Jud.-Alex. Theosophie*, 1835; Daehne, *Jud.-Alex. Religions-Philosophie*, 1834; Dörner, *Person of Christ* (Eng. trans.); Jowett's "St Paul and Philo" (*Epistles of St Paul*, § 363 ff.); Heinze, *Die Lehre v. Logos in Gruch. Philosophie*, 1872; Siegfried, *Philo von Alexandria*, 1875. Grossmann (*Questiones Philonae*, 1829) gives a complete summary of the use of the word in Philo. An account of the Logos literature up to 1870 is given by Dr Abbot in his appendix to the article on "The Word" in the American edition of the *Dictionary of the Bible*, and Soulier includes several later works in *La doctrine du Logos chez Philon d'Alexandrie*, Turin, 1876. (E. A. A.)

GOSPORT, a fortified seaport and market town of Hampshire, England, on the western side of Portsmouth harbour, near its mouth, directly opposite and about a mile from Portsmouth, with which it is connected by a floating bridge moved by a steam engine working on two fixed chains. The old fortifications built at the end of last century are now obsolete, and a line of new forts has been erected about two miles from the town, extending from the Solent to the upper part of Portsmouth harbour, with accommodation for two regiments of infantry and a brigade of artillery. Near the town is the royal St Clarence victualling yard, with brewery, cooperage, powder-magazines, biscuit-baking establishment, and storehouses for various kinds of provisions for the royal navy. Adjoining this yard there are large Government powder magazines and a laboratory for making fuses and rockets. Within the old fortifications a fine new barracks has been erected with accommodation for 1100 men, and another barracks with accommodation for 1600 men adjoining it. The principal other buildings are the town-hall and market-place, the church of Holy Trinity, erected in the time of William III., and the magnificent Haslar naval hospital, capable of containing 2000 patients. Gosport has an extensive establishment for the manufacture of anchors and chain cables, and it is also celebrated for its yacht-building and sail-making establishments. The coasting trade is considerable. The town is said to have received its name, Gosport or God's Port, from Bishop Henry de Blois, who put in here for shelter during a severe storm in 1158. It was then only a small fishing village. According to another supposition its original name was Gorse Port, and it was so called from the gorse and furze with which the commons in the neighbourhood were thickly covered. The population in 1871 was 7366.

GOSSART, JAN, born at Maubeuge towards the close of the 15th century, is better known to Englishmen by the name of Mabuse than by that of Jenni Gossart, with which he signed some of his pictures, or that of Jennyn van Hennegouwe (Hainault), under which he matriculated in the guild of St Luke, at Antwerp, in 1503. We know nothing of his life before he attained to manhood; but his works at least tell us that he stood in his first period under the influence of artists to whom plastic models were familiar; and this leads to the belief that he spent his youth on the French border rather than on the banks of the Scheldt. In no seat of artistic culture is this feature more conspicuous than at Tournai, Douai, or Valenciennes, and it may be that in one of these cities Mabuse learnt to commingle the study of architecture with the gaudy system of

colouring familiar to tinters of stone. Without the subtlety or power of Van der Weyden, he had this much in common with the great master of Tournai and Brussels, that his compositions were usually framed in architectural backgrounds; and this marked characteristic is strongly displayed in the pictures which he executed in the first years of the 16th century. But whilst Mabuse thus early betrays his dependence on the masters of the French frontier, he also confesses admiration for the great painters who first gave lustre to Antwerp; and in the large altar-pieces of Castle Howard and Scawby, he combines in a quaint and not unskilful medley the sentiment of Memling, the bright and decided contrasts of pigment peculiar to coloured reliefs, the cornered and packed drapery familiar to Van der Weyden, and the bold but Socratic cast of face remarkable in the works of Quentin Matsys. At Scawby he illustrates the legend of the count of Toulouse, who parted with his worldly goods to assume the frock of a hermit. At Castle Howard he represents the Adoration of the Kings, and throws together some thirty figures on an architectural background, varied in detail, massive in shape, and fanciful in ornament. He surprises us by pompous costume and flaring contrasts of tone. His figures, like pieces on a chess-board, are often rigid and conventional. The landscape which shows through the colonnades is adorned with towers and steeples in the minute fashion of Van der Weyden. After a residence of a few years at Antwerp, Mabuse took service with Philip, bastard of Philip the Good, at that time Lord of Somerdyk and admiral of Zeeland. One of his pictures had already become celebrated—a Descent from the Cross (50 figures) on the high altar of the monastery of St Michael of Tongerlo. Philip of Burgundy ordered Mabuse to execute a replica for the church of Middleburg; and the value which was then set on the picture is apparent from the fact that Dürer came expressly to Middleburg (1521) to see it. In 1568 the altar-piece perished by fire. But its principal features were preserved in a large arras hanging, recently exhibited at the Archaeological Museum of Brussels. In 1508 Margaret of Austria sent Philip of Burgundy to Italy to negotiate for the treaty of Cambrai. On this mission he was accompanied by Mabuse; and by this accident an important revolution was effected in the art of the Netherlands. Mabuse appears to have chiefly studied in Italy the cold and polished works of the Leonardesques. He not only brought home a new style, but he also introduced the fashion of travelling to Italy; and from that time till the age of Rubens and Van Dyck it was considered proper that all Flemish painters should visit the peninsula. The Flemings grafted Italian mannerisms

on their own stock; and the cross turned out so unfortunately that for a century Flemish art lost all trace of originality.

In the summer of 1509 Philip returned to the Netherlands, and, retiring to his seat of Suytburg in Zeeland, surrendered himself to the pleasures of planning decorations for his castle and ordering pictures of Mabuse and Jacob of Barbari. Being in constant communication with the court of Margaret of Austria at Malines, he gave the artists in his employ fair chances of promotion. Barbari was made court painter to the regent, whilst Mabuse received less important commissions. Records prove that Mabuse painted a portrait of Leonora of Portugal, and other small pieces, for Charles V. in 1516. But the only signed pictures of this period are the Neptune and Amphitrite of 1516 at Berlin, and the Madonna, with a portrait of Jean Carondelet, of 1517, at the Louvre, in both of which we clearly discern that Vasari only spoke by hearsay of the progress made by Mabuse in "the true method of producing pictures full of nude figures and poesies." It is difficult to find anything more coarse or misshapen than the Amphitrite, unless we except the grotesque and ungainly drayman who figures for Neptune. In later forms of the same subject—the Adam and Eve at Hampton Court, or its feebler replica at Berlin—we observe more nudity, combined with realism of the commonest type. Happily Mabuse was capable of higher efforts. His St Luke painting the portrait of the Virgin in Sanct Veit at Prague, a variety of the same subject in the Belvedere at Vienna, the Madonna of the Baring collection in London, or the numerous repetitions of Christ and the Scoffers (Ghent and Antwerp), all prove that travel had left many of Gossart's fundamental peculiarities unaltered. His figures still retain the character of stone; his architecture is as rich and varied, his tones are as strong as ever. But bright contrasts of gaudy tints are replaced by soberer greys; and a cold haze, the "sfumato" of the Milanese, pervades the surfaces. It is but seldom that these features fail to obtrude. When they least show, the master displays a brilliant palette combined with smooth surface and incisive outlines. In this form the Madonnas of Munich and Vienna (1527), the likeness of a girl weighing gold pieces (Berlin), and the portraits of the children of the king of Denmark at Hampton Court, are fair specimens of his skill.

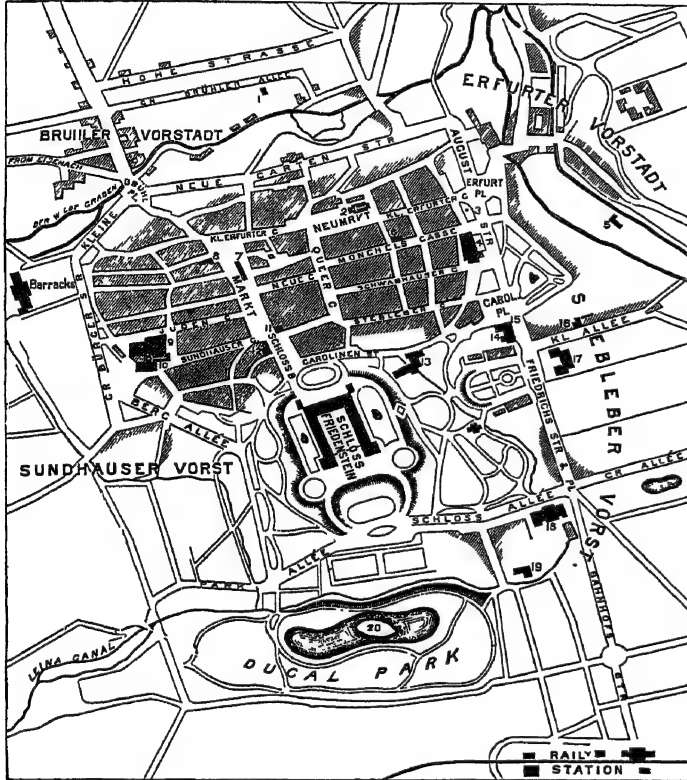

Philip of Burgundy had been deputed in Italy (1515) to escort Charles V.'s sister, Isabella, to Denmark. She was the affianced bride of Christian II., whose subsequent attempt to unite Denmark and Sweden ended so fatally. Here a favourable opportunity was afforded for introducing Mabuse to the Danish court; and it is possible that the opportunity was not neglected. Yet Mabuse may have become acquainted with the Danish king at a later period. As early as 1523, when Christian came to Belgium, he asked Mabuse to paint the likenesses of his dwarfs. In 1528 he requested the artist to furnish to Jean de Hare the design for Isabella's tomb in the abbey of St Pierre near Ghent. It was no doubt at this time that Mabuse completed the portraits of John, Dorothy, and Christine, children of Christian II., which came into the collection of Henry VIII. No doubt, also, these portraits are identical with those of three children at Hampton Court, which were long known and often copied as likenesses of Prince Arthur, Prince Henry, and Princess Margaret of England. One of the copies at Wilton, inscribed with the forged name of "Hans Holbein, ye father," and the false date of 1495, has often been cited as a proof that Mabuse came to England in the reign of Henry VII.; but the statement, it is clear, rests on no foundation whatever. At the period when these portraits were executed Mabuse lived at Middleburg. But he dwelt at intervals elsewhere. When Philip of Burgundy

became bishop of Utrecht, and settled at Duerstede, near Wyck, in 1517, he was accompanied by Mabuse, who helped to decorate the new palace of his master. At Philip's death, in 1524, Mabuse designed and erected his tomb in the church of Wyck. He finally retired to Middleburg, where he took service with Philip's brother, Adolph, lord of Veeren. Van Mander's biography accuses Gossart of habitual drunkenness; yet it describes the splendid appearance of the artist as, dressed in gold brocade, he accompanied Lucas of Leyden on a pleasure trip to Ghent, Malines, and Antwerp in 1527. The works of Mabuse are those of a hardworking and patient artist; the number of his still extant pictures practically demonstrates that he was not a debauchee. The marriage of his daughter with the painter Henry Van der Heyden of Louvain proves that he had a home, and did not live habitually in taverns, as Van Mander suggests. His death at Antwerp, on the 1st of October 1532, is recorded in the portrait engraved by Jerome Cock. (J. A. C.)

GOSELIES, a town of Belgium, in the arrondissement of Charleroi and province of Hennegau, is picturesquely situated on the Piéton and on the Brussels and Charleroi canal, 8 miles N.W. from Charleroi. There are extensive coal-mines in the neighbourhood, and the town possesses breweries, tanneries, bleachworks, and manufactories of hats, knives, and nails. Here the French gained a victory over the Austrians, 26th June 1794. The population is about 7000.

GOTHA (originally *Gotegewe*, or *Gotawe*, and later *Gotaha*, or *Gothau*), a town of Germany, formerly capital of the old duchy of Gotha, and now, alternately with Coburg, the residence of the duke of Saxe-Coburg. Gotha is situated on a canal of the Leina, and on the Thuringian railway, about 6 miles north of the Thuringian Forest. It consists of the town proper and four suburbs, which are grouped in the shape of a half-moon to the north, west, and east of the hill on which, at the height of 1086 feet, stands the castle of Friedenstein. With the exception of those in the older portion of the town, the streets are handsome and spacious, and the beautiful gardens and promenades between the suburbs and the castle add greatly to the town's attractiveness. On the other side of the castle there is an extensive and finely adorned park. To the north-west of the town the Gulberg hill,—on which there is a public pleasure garden,—and to the south-west the Leeberg hill, rise to a height of over 1300 feet, and afford extensive views of a beautiful panorama. The castle, begun by Ernest the Pious in 1643 and completed in 1654, occupies the site of the old fortress of Grimmenstein. It is a huge square building flanked with two wings, having towers rising to the height of about 140 feet. It contains the ducal coin cabinet, and the ducal library of nearly 200,000 volumes, among which are several rare editions, and about 6900 manuscripts. The picture gallery, the cabinet of engravings, the natural history museum, the Chinese museum, and the cabinet of art, which includes a collection of Egyptian, Etruscan, Roman, and German antiquities, are now included in a new building, completed in 1878, which stands on the southern terrace of the castle. The principal other public buildings are the Margaret church,—with a beautiful portal and a lofty tower,—founded in the 12th century, twice burnt down, and rebuilt in its present form in 1652; the Augustines or Cloister church, with an altar-piece by the painter Jacobs; the theatre; the fire insurance bank and the life insurance bank; the ducal palace, in the Italian villa style, with a winter garden and picture gallery; the buildings of the legislature of the duchy; the hospital; the old town-house, dating from the 11th century; the old dwelling-house of the painter Lucas Cranach, now used as a girls' school; the ducal stable; and the Friedrichsthal

palace. The educational establishments include excellent city schools, a gymnasium (founded in 1524, one of the most famous in Germany), a ladies' school of the first order, a training school for teachers and another for female teachers, a free school, a trade school, and a commercial school. Among the other institutions are a lying-in hospital, a surgical and eye hospital, a private lunatic asylum, an orphanage, a reformatory, a magdalen institute, and a school for the board and education of destitute girls. The observatory, erected by Duke Ernest II. in 1787, was in 1857 transferred to a new site in the neighbourhood of the park. Formerly the town obtained its water supply

Plan of Gotha.

by means of the Leina canal, which was excavated in 1369, but water for drinking purposes has since 1874 been obtained from the Thuringian Forest. Gotha is one of the most active commercial towns of Thuringia, its manufactures including sausages, for which it has a great reputation, porcelain, tobacco, sugar, machinery, mechanical and surgical instruments, musical instruments, shoes, lamps, and toys. There are also a number of nurseries and market gardens. The book trade is represented by about a dozen firms, including that of the great geographical house of Perthes. Population (1875), 22,928.

Gotha existed as a village in the time of Charlemagne. In 930 the Abbot Gotthard of Hersfeld surrounded it with walls. It was known as a town as early as 1109, about which time it came into the possession of the landgraves of Thuringia. On the extinction of that line Gotha came into the possession of the electors of Saxony, and on the division of their estates between Frederick the Soft-hearted and William, it fell to the share of the latter, after whose death it was inherited by the Ernestine line of dukes. After the battle of Mühlberg in 1547, the castle of Grimmerstein was partly destroyed, but it was again restored in 1554. In 1566 the town was taken from Duke John Frederick by August of Saxony. After the death without issue of John Frederick's two sons, it came

into the possession of Duke Ernest the Pious, the fourth of the line of the dukes of Gotha; and on the extinction of this line it was, in 1826, united, along with the dukedom, to Coburg.

GOTHENBURG (Swedish, *Göteborg*), the second city and chief commercial town of Sweden, and the capital of a "lan" of the same name, is situated in a low valley surrounded by bare hills, on the south bank and  $1\frac{1}{2}$  miles from the mouth of the Gotha river, 282 miles W.S.W. of Stockholm by rail (by the Gotha Canal 370 miles). Gothenburg is well and regularly built, mostly of stone or brick, with wide and well-paved streets, and in its general appearance much resembles an English town. It consists of two main portions, the town proper and its suburbs,—together  $5\frac{1}{2}$  square miles in extent. The first may be described as a semicircle extending south-eastward over a marshy flat from the bank of the Gotha as its diameter. This semicircle is crossed by the East and West Harbour Canals and from east to west by the Great Harbour Canal, which divides the town proper into two parts, a north and a south. The canals are enclosed with hewn stone, lined with trees, and crossed by 24 iron bridges. The finest streets of Gothenburg are the North and South Harbour Streets. Gustavus Adolphus's *Torg* (market-place), with a bronze statue of Gustavus Adolphus by Fogelberg, occupies the centre of the town, while the principal market-place is now (since 1849) *Kungstorget* (the king's market-place). The favourite promenades are the Horticultural Society's Park, the King's Park, with Molin's group (the Beltbucklers) and the *Nya Alléen* (new alleys), situated on the south outskirts. Gothenburg has seven Lutheran churches, of which the finest are the cathedral (*Gustavii Domkyrka*), called after Gustavus Adolphus, founded 1633, rebuilt after fires in 1742 and 1815, now a cruciform structure 173 feet high and 194 feet long by 75 feet broad, Haga church, erected in 1856, and the German church, rebuilt 1747–1798; an English Episcopal church (1855); a Catholic chapel; and a synagogue (1855). The other chief buildings are the exchange, in Italian style (1844), with marble statues of Odin by Fogelberg (1855), and of Oscar I. by Molin (1855); the residence house, built by Torstenson after the Thirty Years' War; the town-house, founded 1670, enlarged 1814; the old *kronhus*, where the diet of 1660 was held; the new custom-house (1866); the artillery barracks (1806) for 750 men; the prison (1854); the railway station (1858); the arsenal (1860); the new theatre (1856–59) seated for 1030; and the Sahlgren new hospital (1848–55). Gothenburg is the seat of a bishop and of a provincial governor. It has 34 schools of various kinds, including two Latin schools, a school-teachers' seminary, an extensive *Elementär-läroverk*, founded 1630, rebuilt 1859, with a library of 15,000 vols., a trade institute, the Chalmers' technical school (1869), another technical school (1848), a "real-gymnasium" (1844), and a navigation-school (1862). The museum, founded in 1833, contains collections for natural history, entomology, anatomy, botany, archæology, and ethnography, a picture and sculpture gallery, and a collection of 6000 coins and medals. Gothenburg has numerous benevolent and charitable institutions, mainly supported by the munificence of private citizens. The industries are ship-building (carried on in four docks), linen and cotton weaving, brewing, and the manufacture of furniture, machinery, lucifer-matches, paper, sugar, and tobacco. In 1877, 2213 ships of 532,127 tons (Swedish, 1221 of 270,900 tons; British, 267 of 130,219 tons) entered at the port, while 1781 ships of 526,352 tons (British, 264 of 118,236 tons) cleared. The mercantile fleet be-

longing to Gothenburg consisted on January 1, 1878, of 65 steamships of 21,215 tons, and 156 sailing vessels of 63,913 tons. The exports in 1877 amounted in value to £2,437,200. These included 8,107,326 cubic feet of deals, boards, and battens (6,021,546 cubic feet to England); 6,065,408 cubic feet of pit-props and other timber, besides 7,246,056 pieces of oak and other staves, and laths and carpenters' work valued at £80,083; 90,460 tons of iron and steel (62,480 tons to England); 333,194 quarters of grain, chiefly oats (265,655 quarters to England); also beans and pease, lucifer matches, 2667 head of cattle, and 38,578 cwt. of butter. The imports in the same year amounted to £3,865,000, chiefly made up of cotton (14,540,996 lb) and cotton yarn (3,608,355 lb), wool and woollen yarn (3,397,757 lb), raw sugar (17,289,777 lb), refined sugar (6,512,919 lb), coffee (8,239,346 lb), molasses (4,883,021 lb), rice (3,246,247 lb), olive oil (2,443,804 lb), salt (796,208 cubic feet), coal and coke (246,205 tons), iron rails (32,059 tons), petroleum (13,243,408 lb), hides (2,346,577 lb), and paper (712,538 lb). Under the peculiar licensing system initiated in Gothenburg October 1, 1865, the town authorities contract for three years with a limited company, which takes the whole number of licences for selling *brandin*, and hands over to the town treasury the net proceeds of its trade. These amounted to £40,103 in the year ending October 1, 1876, when the company sold 383,561 gallons of spirits, 178,133 gallons of which were consumed on the public-house premises, and realized a gross profit of £52,850. The licences issued have been reduced from 119 in 1865 to 56 in 1876. All "bars" are closed from 6 P.M. on Saturday to 8 A.M. on Monday, and in the period 1866-76 apprehensions for drunkenness have on the average decreased 22 per cent., though since 1870 there has been a slight increase (in 1876, 2357 persons were fined), usually attributed to the higher rate of wages and the greater efficiency of the police. The population of Gothenburg, including suburbs, was 71,707 in 1877.

Founded by Gustavus Adolphus in 1619, Gothenburg was from the first designed to be fortified, a town of the same name founded on Hisingen (an island 44 square miles in area between the two arms of the Gotha river) having been destroyed by the Danes during the Calmar war. From 1621, when it was first chartered, it steadily increased, though it suffered greatly in the Danish wars of the last half of the 17th and the beginning of the 18th centuries, and from several extensive conflagrations (the last in 1818), which have destroyed important records of its history. The great development of its herring fishery in the latter part of the 18th century gave a new impulse to the city's trade, which was kept up by the influence of the "Continental System," under which Gothenburg became a *dépôt* for the colonial merchandise of England. After the fall of Napoleon it began to decline, but since its closer connexion with the interior of the country by the Gotha Canal (opened 1832) and Western Railway it has rapidly advanced both in population and trade. It is expected that the great line now in course of construction through the mining districts will very greatly increase the importance of Gothenburg. Since the demolition of its fortifications in 1807, it has been defended only by the two redoubts of Billingen and Rya Rabbe. Gothenburg was the birthplace of the poet Bengt Lidner, and of two of Sweden's greatest sculptors, Fogelberg and Molin. After the French Revolution Gothenburg was for a time the residence of the Bourbon family.

**GOTHIC LANGUAGE.** See under **GOTHS**, p. 852.

**GOTHOFRED** or **GODEFROY**, the name of a noble French family, of which many members attained distinction as jurists or historians.

The first whose name is associated with the active study of jurisprudence, at the close of the 16th century, was **DENIS GODEFROY** (1549-1621). He was born at Paris, and

studied law at the universities of Louvain, Cologne, and Heidelberg. Having embraced the Reformed religion, he found Geneva a safer abode than Paris, and became professor of law there. Some years afterwards he obtained a public appointment in one of the districts in the Jura, but was driven from his home by the troops of the duke of Savoy and retired to Basel. Thence he was induced by the offer of a chair of Roman law to go to Strasburg, but soon changed his appointment for one at Altorf, which then possessed a university celebrated for its late professor of law, Donneau. In 1600 the elector palatine appointed him professor of Roman law in Heidelberg, where he spent the greater portion of the remainder of his life, and was placed at the head of the faculty of law. The most flattering offers from several universities failed to induce him to leave his adopted country, but the invasion of the Palatinate by Tilly's troops forced him to take refuge again at Strasburg, where he died in 1621. His most important work is his edition of the *Corpus Juris*. The text given by him was very generally adopted and used in quotation. More than twenty editions of the work were published in various towns of France, Germany, and Holland. Godefroy's other writings are very numerous; but they are for the most part either editions of classical authors or compilations which display great industry and learning, but are of little use to the modern student.

**THEODORE GODEFROY** (1580-1649), the eldest son of Denis, forsook the religion which his father had adopted, and obtained the office of historiographer of France, as well as several important diplomatic posts. His historical works are very numerous. The character of his labours will be judged from the title of his most elaborate production—*Le Cérémonial de France*. Many of his smaller works are devoted to questions of genealogy.

**JACQUES GODEFROY** (1587-1652), the younger brother of Theodore, has a real claim to the remembrance of students of the history of Roman law, in his edition of the *Theodosian Code*, at which he laboured for thirty years. It was this code, and not the *Corpus Juris* prepared under the direction of Justinian, which formed the principal, though not the only source from which the lawyers of the various countries which had formed the Western empire drew their knowledge of Roman law, at all events until the revival of the study of law in the 11th century at Bologna. Hence Godefroy's edition was of real value. Jacques Godefroy also completed the difficult and useful task of collecting and arranging those fragments of the *Twelve Tables* which can be discovered, and so an important step was taken towards representing the Roman law in its first definite form. His other works are very numerous, and are principally devoted to the discussion of various points of Roman law. He died in 1652, having served the republic of Geneva both as its principal magistrate and in undertaking important missions to the court of France.

A list of the works of the various members of the family of Godefroy, whose activity extends over a period of nearly 200 years, may be found in the *Biographie Générale*, and fuller particulars of its history in Moreri's *Dictionnaire historique*.

**GOTHS.** The historical position of the Gothic nation needs to be marked out with special care, both on account of various lax popular uses of the Gothic name, and also on account of much legendary history and many rash ethnological speculations, ancient and modern, which have gathered round the true history of the Gothic people. An ignorant age used the words *Goth* and *Gothic* as vague names of contempt for anything that was thought rude and barbarous. A hardly less ignorant but better disposed age used the word *Gothic* in an equally vague way, but without the same feeling of contempt, for anything which was thought to be mediæval or "romantic," as opposed to

"classical." The name came also to be used as a philological or ethnological term; we heard of "Gothic nations," "Gothic languages," &c., meaning "Teutonic" in the widest sense. The name was also, first scornfully, then respectfully, applied to a style of architecture which has some claim to be called Teutonic as opposed to Greek or Roman, but which has nothing whatever to do with the Goths as a nation. Long before this, two European sovereigns who had nothing whatever to do with the national Goths, took the title of King of the Goths out of a mere accidental likeness of names. All these uses of the Gothic name must be carefully distinguished from the history of the true national Goths who play so great a part in Europe from the 3d to the 8th century of our era. The Goths may on many grounds claim the foremost place among the Teutonic nations which had a share in the break-up of the Roman power. They were among the earliest, if not quite the earliest, of the Teutonic nations to establish themselves within the empire, as distinguished from merely ravaging its frontiers. Their history too is closely connected with the geography of the whole empire. Their first historical appearance was in the East; their great historical settlements were made in the West. No Teutonic people fills so great a place in the political and military history of the 4th, 5th, and 6th centuries, and no Teutonic people has left behind it such early remains of a written native literature. The real greatness of the Goths quite accounts for the many vague uses of the Gothic name. Alike in scorn and in honour, the Goths have been, not unreasonably, taken as the representatives of the whole Teutonic race. The wonderful thing is that a people who played so great a part for several ages should have wholly passed away. The Goths have not for many ages existed anywhere as a distinct nation, nor have they given an abiding name to any part of Europe. Franks, Angles, Saxons, Burgundians, Frisians, Thuringians, Lombards, Bavarians, perhaps Vandals, are all visible on the modern map. So several parts of Europe have at different times been known as *Gothia*; but the name was never borne by any large country, and it has nowhere lasted down to modern times.

The chief ancient authority for the early history of the Goths is their national historian Jordanis, who chiefly followed the Gothic history of Cassiodorus the minister of Theodoric, and the lost history of Ablavius. (On the value of Jordanis's writings see Pallmann, *Geschichte der Völkerwanderung*, i. 23.) But he is careless and uncritical, and, like other national historians, is full of mythical elements in the early part. He has to be tested throughout by the contemporary Roman and Greek writers from the 3d century to the 6th. Among these, perhaps the first place is due to Ammianus in the 4th century and to Procopius in the 6th.

The first certain historical appearance of the Goths is in the lands north of the lower Danube in the 3d century of our era. For any earlier account of them we have to go either to mythical stories or to ingenious guesses and inferences. There are a remarkable number of national and legendary names which have more or less of likeness to the name *Goth*; and this likeness has naturally led to an unusual number of theories. The Goths first appear in history in the ancient land of the *Getæ*; and this geographical fact, combined with the likeness of the names, has naturally caused *Getæ* and *Goths* to be looked on as the same people. The identification is as old as our first historical mention of the Goths (Ælius Spartianus, *Ant. Car.*, 10). Claudian always speaks of the Goths as *Getæ*. So does the national historian Jordanis (cap. v.). The identity is mentioned doubtfully by Procopius (*Bell. Vand.*, i. 2; cf. *Bell. Goth.*, v. 4). It is strongly maintained by Jacob Grimm (*Geschichte der Deutschen Sprache*, capp. ix., xviii.), but is rejected by

nearly all later writers. A more famous legend, which has derived its chief currency from Jordanis, brings the Goths first of all from Scandinavia (see Gibbon, c. x.; Geijer's *History of Sweden*, c. x.). There is a so-called East and West Gothland in Sweden, but the connexion of these lands with the Goths of Roman history is more than doubtful. Ptolemy (ii. 11, 35) places the *Γούραι* in Scandia, and Procopius (*Bell. Goth.*, ii. 15) knew the *Γαυροί* among the inhabitants of Thoule; but he clearly did not look on them as Goths (see Zeuss, *Die Deutschen*, 500, 511; Grimm, p. 312). Then there is the god *Gedǫ* (see Kemble's *Saxons in England*, i. 370), and the *Geatas*, who figure in Beowulf, and elsewhere in Old-English writings. The Traveller's Song (34, 115, 177) distinctly distinguishes *Goths* and *Geatas*, and couples the latter with the Swedes. Pliny (*Nat. Hist.*, iv. 11) places *Getæ* and *Gaudæ* together on the lower Danube. His *Gaudæ* may possibly be Goths; if so, they are distinguished from the *Getæ*. Then there are the *Jutes* of Old-English history, the *Guttones*, *Gothones*, *Gothini* (see Latham, *Germania*, Epilegomena xxxviii. et seqq.). Pytheas, according to Pliny (*Nat. Hist.*, xxxvii. 7; cf. iv. 14) placed the *Guttones* on the south coast of the Baltic (that seems to be his meaning), and rules them to be a German people. This carries the name back to the time of Alexander. Ptolemy also (iii. 5, 20) has *Γίθωνες* in Sarmatia on the Vistula. Tacitus (*Germania*, 43) distinguishes the German *Gothones* in the same region from the Celtic *Gothini*, whom he places seemingly nearer to the Carpathians. Tacitus moreover not only speaks of the *Gothones* or *Gotones* as a people, but mentions (*Ann.*, ii. 62) a particular man of the nation, Catualda by name, as having restored the independence of his people after it had been overthrown by Maroboduus. With this hint, it is perhaps not too much to infer with Aschbach (*Westgothen*, 2d ed.) and Zeuss (136) that for *Βούτροες* in Strabo (vii. 1), who are mentioned among the nations subject to Maroboduus, we should read *Γούτροες*. And there is no doubt that names like *Getæ*, *Gethæ*, *Guddæ*, even *Gothi*, lived on almost to modern times, first as national names, then as names of contempt, in Poland, Lithuania, and Prussia (see Latham, and Zeuss, 672). Latham asserts the identity of the names *Getæ*, *Gothi*, and *Gothones*, but he holds (see especially p. 42 of his Epilegomena) that both *Gothones* and *Getæ* were Lithuanian, and that the Teutonic Goths took the name of the people whom they had conquered. They would, on this view, be Goths only in the sense in which Englishmen are Britons.

On the whole, it seems that there is no trustworthy evidence for a migration of the Goths from Scandinavia, and that the idea was suggested only by the likeness of name between the true Goths and the *Gauts* or *Geatas* of Swedish history. The application of the name *Gothland* to the island *Gotland*, as well as to the continental *Gauthiod*, is a further mistake. Nor does there seem to be any reason for making *Goths* and *Getæ* the same. But the identification of the Goths with the *Gothones*, *Γούτροες*, *Guttones*, on the south coast of the Baltic (which is accepted by Pallmann and Dahn) has much more to be said for it. *Gothi* and *Gothones* are strictly the same name; the double form is usual in the Latin shapes of Teutonic names. But the whole history of the Goths in their northern seats is summed up in the personal history of Catualda, who, after delivering his people from Maroboduus, was himself overthrown by the Hermunduri. The continuous and certain history of the Gothic nation begins in the Roman Dacia.

The question now comes, Which of the nations which are historically connected with the Goths had any closer connexion with them than that of common Teutonic origin? Setting aside *Getæ* and other doubtful theories, the real

Gothic name is used by the Greek and Latin writers in a wider and in a narrower sense. We must also bear in mind the vague way in which the ancient writers used national names, and their fondness for using obsolete names. Thus the Goths and other Teutonic nations are spoken of as Scythians and Sarmatians. Procopius, in an evidently well-considered passage (*Bell. Vand.*, i. 2), speaks of the Goths as having been formerly called *Σαυρομάται καὶ Μελέγχλαινοι*, names which come out of Herodotus's description of the regions where the Goths first appear. But he gives it as the definite result of his own observations that Goths,—by this name he always means specially the East-Goths,—Vandals, West-Goths, and Gepidæ (*Γήπαιδες*, with an evident intention to give the word a Greek meaning) were originally one nation, speaking one Gothic language. The only question is about the Vandals. The Gepidæ are commonly acknowledged as a branch of the Goths, and Jordanis (17) has a legend which implies their kindred. The Taifalæ (Ammianus, xxxi. 19), the Bastarnæ, Peucini, and other tribes are also reckoned among the Gothic races. In other passages Procopius speaks of several other nations, as the Alans, Rogi, and Scirri, as Gothic, but he does not seem to be in the same way pronouncing a definite judgment. Among all these, the historical Goths, who play a part in European history by that name, consist of the East and West Goths, and of the small division called Tetraxitæ. The division into East and West Goths does not appear in the earlier writers, as Ammianus and Zosimus, but we find it both in Procopius and in Jordanis. Instead of East-Goths and West-Goths, we read in Ammianus, Zosimus, and Claudian of *Greuthungi* and *Tervingi*. These seem to be (see Aschbach, 21; Zeuss, 406; Köpke, 103) the strictly national names of the two divisions, which took the names of East and West Goths from their geographical position in the lands which they entered. There is an exact parallel in England, where the national name of the *Gewissas* gives way to the geographical name of *West-Saxons*. Jordanis indeed doubts whether the East-Goths were so called from their eastern position, or from a king Ostrogotha. Strange to say, this Ostrogotha seems to be a real person, and not a mere mythical eponym. *Ὀύστργόθρος* (Procop., *Bell. Goth.*, iv. 27) is an historical person at a later date, and the name is borne in a feminine shape by one of the daughters of Theodoric. The history of the East and West Goths, as far as the empire is concerned, falls naturally into three periods. In the 3d century they are still settled outside the empire, and appear as invaders and ravagers of the Roman territory from outside. After an interval in which they almost sink out of notice, they appear again within the bounds of the empire, in various relations of alliance and enmity, marching to and fro, but not making any lasting settlement. It is not till the 5th century that they begin to form settled powers. During their wandering stage they appear mainly in the Eastern empire. But neither they nor any other Teutonic people founded any permanent settlement within its borders. The historical settlements of the Goths are the short and brilliant dominion of the East-Goths in Italy, and the more lasting dominion of the West-Goths in Gaul and Spain.

After the first vague mention of the Goths under Antoninus Caracalla, they begin to play a distinct part in the reign of Alexander Severus. They were then in Dacia, and received a tribute or subsidy of some kind (Petrus Patricius, 124, ed. Bonn). The next emperor, Maximin, is claimed by Jordanis (15) as himself of Gothic birth, but we may suspect the usual confusion with the *Getæ*. The narrative of Jordanis begins from this point to put on a more historical character, and his account is helped out by various notices in the Augustan History. In the reign of Philip (244–248 A.D.) they passed the Danube and ravaged Moesia,

and in 251 the emperor Decius fell in battle against them (see Zosimus, i. 19 *et seqq.*). From this time they ravaged eastern Europe and western Asia far and wide (251–268). They carried on their warfare by sea, and reached as far east as Trebizond. And it seems to have been now that the first permanent Gothic settlement was made, though not strictly within the lands of the empire. This was in the Tauric Chersonesos or Crim. Here their settlement lasted for many ages, and they became allies rather than subjects of the empire in the reign of Justinian. Within the empire the Gothic inroads met with repulses at several points, especially from the local forces of Athens under the historian Dexippus (Trebellius, Gallienus 13, and the fragment of Dexippus himself). At last, in 269, the Goths suffered a decisive defeat from the emperor Claudius at Naissus in Dardania, which formed an epoch in Gothic history. It answers to the repulse of the Saxons from Britain by the elder Theodosius. The first attempt at Gothic settlement south of the Danube had been premature. It had to be repeated at a later time with greater success.

Further victories over the Goths are attributed to Aurelian. But the chief event of his reign was one which amounted to a legal acknowledgment of Gothic occupation north of the Danube. The Roman legions were withdrawn from Dacia, and the name of Trajan's great conquest was transferred to the land south of the Danube (274). That is, the great river was established as the boundary between the Roman and Gothic dominions. The wisdom of this cession is shown by its being followed by a period of ninety years in which the peace between the Goths and the empire was seldom seriously broken. The chief interruption was during the reign of Constantine, when the Gothic king Araric invaded the empire, and, after some momentary successes, was driven back. In the middle of the 4th century a great power arose under the East-Gothic king Ermanaric (less correctly *Hermanric*; the name is the same as *Eormenric*, in the royal line of Kent), of the house of the Amali, which was reckoned to be the noblest among the Goths. Ermanaric has become a great figure in Teutonic legend, and it is not easy to say how far legend has built upon history, and how far so-called history has drawn from legend. But that Ermanaric was a real man, and the founder of a great dominion, is plain from the few words of Ammianus (xxxii. 3). Yet there is something unsatisfactory in the way in which we read vague accounts of the greatness of his power, with hardly a glimpse of himself personally. The period assigned to his reign is full of stirring events, in which we get a clear conception of much lesser Gothic chiefs, but none of Ermanaric himself. Jordanis (23) claims for him a vast dominion stretching from the Danube to the Baltic, and he is specially emphatic on the subjection of the Slavonic nations to the rule of the Gothic overlord. With regard to the Gothic nations, we can see that the rule of Ermanaric was a mere overlordship. The West-Goths appear as a distinct people, with the power of making war and peace on their own account. But they had no kings; their great chief Athanaric appears only as "judge" (Ammianus, xxvii. 5; xxxii. 3), answering to our *ealdorman* or *heretoga* (cf. Jordanis, 26); and along with him are other West-Gothic chiefs, specially his rival Frithigern. We hear of a civil war between these two rivals (Socrates, iv. 33), and it is more certain that Athanaric made war within the Roman border as an ally of the usurper of Procopius in 365, and afterwards made peace with the emperor Valens. By this time Christianity was making swift advances among the Goths. According to the view of some modern writers (Köpke, 123; Pallmann, ii. 63), the outlying Gothic settlement in Crim had been Christian and Catholic from the beginning; but now Christianity in its Arian form began to be gradually accepted by the great

mass of the Gothic nation. This was mainly the work of the teaching of Ulfila (see ULFILA), the Gothic apostle and translator of the Scriptures into the Gothic tongue (Sozomen, iv. 24). According to some accounts (Pallmann, i. 71), he had, to avoid persecution, led a Christian colony south of the Danube (348), who settled peaceably at Nicopolis, and are hence known as Mosogoths (seemingly the *Gothi Minores* of Jordanis, 51). Later, in 370, there was another great persecution, in which Athanaric, the special enemy of everything Roman, appears also as the enemy of the Christians, while Frithigern is their friend (Sozomen, vi. 37; Socrates, iv. 33). The distinction between Christian and heathen Goths remains of political importance for some time. But both East and West Goths had fully embraced Arianism long before the end of the 5th century, while the Goths of Crim seem to have remained Catholic, and received Catholic bishops from Saint John Chrysostom, and afterwards from Justinian.

Towards the end of the reign of Ermanaric several causes joined together to break his great dominion asunder. There were clearly signs of division between East and West Goths, between Christians and heathens, as well as discontents among the subject nations. These causes of division were now strengthened by pressure from without. Now began the first of those movements of the Turanian races into the lands north of the Danube, which have had such an effect on the history of south-eastern Europe down to our own time. The Huns pressed on the new dominion of the Goths, which was already beginning to break in pieces. Ermanaric died at the age, it is said, of 110, by the hands of subject princes stirred to wrath by his cruelties (Jordanis, 24). All thought of a lasting Gothic dominion north of the Danube died with him. With his fall the movements south of that river began again on a great scale.

From this time the history of the East and West Goths parts asunder, to be joined together again only incidentally and for a season. The great mass of the East-Goths stayed north of the Danube, and passed under the overlordship of the Hun. They do not for the present play any important part in the affairs of the empire. The great mass of the West-Goths crossed the Danube into the Roman provinces, and there played a most important part in various characters of alliance and enmity. The great migration was in 376, when they were allowed to pass as peaceful settlers under their chief Frithigern. His rival Athanaric seems to have tried to maintain his party for a while north of the Danube in defiance of the Huns; but he had presently to follow the example of the great mass of the nation. The peaceful designs of Frithigern were meanwhile thwarted by the ill-treatment which the Goths suffered from the Roman officials, which led first to disputes and then to open war. In 378 the Goths won the great battle of Adrianople, in which the emperor Valens was killed. His successor Theodosius the Great made terms with them in 381, and the mass of the Gothic warriors entered the Roman service as *foederati*. Many of their chiefs were in high favour; but it seems that the orthodox Theodosius showed more favour to the still remaining heathen party among the Goths than to the larger part of them who had embraced Arian Christianity. Athanaric himself came to Constantinople in 381; he was received with high honours, and had a solemn funeral when he died. His saying is worth recording, as an example of the effect which Roman civilization had on the Teutonic mind. "The emperor," he said, "was a god upon earth, and he who resisted him would have his blood on his own head."

The death of Theodosius in 395 broke up the union between the West-Goths and the empire. Dissensions arose between them and the ministers of Arcadius; the Goths threw off their allegiance, and chose Alaric as their

king. This was a restoration alike of national unity and of national independence. The royal title had not been borne by their leaders in the Roman service. Alaric's position is quite different from that of several Goths in the Roman service, who appear as simple rebels (see Köpke, 128). He was of the great West-Gothic house of the Balti (bold), a house second in nobility only to that of the Amali. His whole career was taken up with marchings to and fro within the lands, first of the Eastern, then of the Western empire. The Goths are under him an independent people under a national king; their independence is in no way interfered with if the Gothic king, in a moment of peace, accepts the office and titles of a Roman general. But under Alaric the Goths make no lasting settlement. In the long tale of intrigue and warfare between the Goths and the two imperial courts which fills up this whole time, cessions of territory are offered to the Goths, provinces are occupied by them, but as yet they do not take root anywhere; no Western land as yet becomes *Gothia*. Alaric's designs of settlement seem in his first stage to have still kept east of the Adriatic, in Illyricum, possibly in Greece. Towards the end of his career his eyes seem fixed on Africa (see Köpke, 128).

Greece was the scene of his great campaign in 396, the second Gothic invasion of that country. In this campaign the religious position of the Goths is strongly marked. The Arian appeared as an enemy alike to the pagan majority and the Catholic minority; but he came surrounded by monks, and his chief wrath was directed against the heathen temples (Hertzberg, *Geschichte Griechenlands*, iii. 391). His Italian campaigns fall into two great divisions, that of 402-3, when he was driven back by Stilicho, and that of 408-10, after Stilicho's death. In this second war he thrice besieged Rome (408, 409, 410). The second time it suited a momentary policy to set up a puppet emperor of his own, and even to accept a military commission from him. The third time he sacked the city, the first time since Brennus that Rome had been taken by an army of utter foreigners. The intricate political and military details of these campaigns are of less importance in the history of the Gothic nation than the stage which Alaric's reign marks in the history of that nation. It stands between two periods of settlement within the empire and of service under the empire. Under Alaric there is no settlement, and service is quite secondary and precarious; after his death in 410 the two begin again in new shapes.

Contemporary with the campaigns of Alaric was a barbarian invasion of Italy, which, according to one view, again brings the East and West Goths together. The great mass of the East-Goths, as has been already said, became one of the many nations which were under vassalage to the Huns; but their relation was one merely of vassalage. They remained a distinct people under kings of their own, kings of the house of the Amali and of the kindred of Ermanaric (Jordanis, 48). They had to follow the lead of the Huns in war, but they were also able to carry on wars of their own; and it has been held (see Köpke, 139; Pallmann, ii. 173, 277) that among these separate East-Gothic enterprises we are to place the invasion of Italy in 405 by Radagaisus (whom Pallmann writes Ratiger, and takes him for the chief of the heathen part of the East-Goths). One chronicler, Prosper, makes this invasion preceded by another in 400, in which Alaric and Radagaisus appear as partners. The paganism of Radagaisus is certain. The presence of Goths in his army is certain, but it seems dangerous to infer that his invasion was a national Gothic enterprise.

Under Ataulf, the brother-in-law and successor of Alaric, another era opens, the beginning of enterprises which did in the end lead to the establishment of a settled Gothic monarchy in the West. The position of Ataulf is well

marked by the speech put into his mouth by Orosius. He had at one time dreamed of destroying the Roman power, of turning *Romania* into *Gothia*, and putting Ataulf in the stead of Augustus; but he had learned that the world could be governed only by the laws of Rome, and he had determined to use the Gothic arms for the support of the Roman power. And in the confused and contradictory accounts of his actions (for the story in Jordanis cannot be reconciled with the accounts in Olympiodorus and the chroniclers), we can see something of this principle at work throughout. Gaul and Spain were overrun both by barbarian invaders and by rival emperors. The sword of the Goth was to win back the lost lands for Rome. And, amid many shiftings of allegiance, Ataulf seems never to have wholly given up the position of an ally of the empire. His marriage with Placidia, the daughter of the great Theodosius, was taken as the seal of the union between Goth and Roman, and, had their son Theodosius lived, a dynasty might have arisen uniting both claims. But the career of Ataulf was cut short at Barcelona in 415, by his murder at the hands of another faction of the Goths. The reign of Sigeric was momentary. Under Wallia in 418 a more settled state of things was established. The empire received again, as the prize of Gothic victories, the Tarraconensis in Spain, and Novempopulana and the Narbonensis in Gaul. The "second Aquitaine," with the sea-coast from the mouth of the Garonne to the mouth of the Loire, became the West-Gothic kingdom of Toulouse. The dominion of the Goths was now strictly Gaulish; their lasting Spanish dominion does not yet begin.

The reign of the first West-Gothic Theodoric (418-451) shows a shifting state of relations between the Roman and Gothic powers; but, after defeats and successes both ways, the older relation of alliance against common enemies was again established. At last Goth and Roman had to join together against the common enemy of Europe and Christendom, Attila the Hun. But they met Gothic warriors in his army. By the terms of their subjection to the Huns, the East-Goths came to fight for Attila against Christendom at Châlons, just as the Servians came to fight for Bajazet against Christendom at Nicopolis. Theodoric fell in the battle (451). After this momentary meeting, the history of the East and West Goths again separates for a while. The kingdom of Toulouse grew within Gaul at the expense of the empire, and in Spain at the expense of the Suevi. Under Euric (466-488) the West-Gothic power again became largely a Spanish power. The kingdom of Toulouse took in nearly all Gaul south of the Loire and west of the Rhone, with all Spain, except the north-west corner, which was still held by the Suevi. Provence alone remained to the empire. The West-Gothic kings largely adopted Roman manners and culture; but, as they still kept to their original Arian creed, their rule never became thoroughly acceptable to their Catholic subjects. They stood therefore at a great disadvantage when a new and aggressive Catholic power appeared in Gaul through the conversion of the Frank Chlodwig. Toulouse was, as in days long after, the seat of an heretical power, against which the forces of northern Gaul marched as on a crusade. In 507 the West-Gothic king Alaric fell before the Frankish arms at Bouglé, near Poitiers, and his kingdom, as a great power north of the Alps, fell with him. That Spain and a fragment of Gaul still remained to form a West-Gothic kingdom was owing to the intervention of the East-Goths under the rule of the greatest man in Gothic history.

When the Hunnish power broke in pieces on the death of Attila, the East-Goths recovered their full independence. They now entered into relations with the empire, and were settled on lands in Pannonia. During the greater part of the latter half of the 5th century, the East-Goths play in

south-eastern Europe nearly the same part which the West-Goths played in the century before. They are seen going to and fro, in every conceivable relation of friendship and enmity with the Eastern Roman power, till, just as the West-Goths had done before them, they pass from the East to the West. They are still ruled by kings of the house of the Amali, and from that house there now steps forward a great figure, famous alike in history and in romance, in the person of Theodoric son of Theodemir. Born about 454, his childhood was spent at Constantinople as a hostage, where he was carefully educated. The former part of his life is taken up with various disputes, intrigues, and wars within the Eastern empire, in which he has as his rival another Theodoric, son of Triarius, and surnamed Strabo. This older but lesser Theodoric seems to have been the chief (not king) of that branch of the East-Goths which had settled within the empire at an earlier time. Theodoric the Great, as he is sometimes distinguished, is sometimes the friend, sometimes the enemy, of the empire. In the former case he is clothed with various Roman titles and offices, as patrician and consul; but in all cases alike he remains the national East-Gothic king. It was in both characters together that he set out in 488, by commission from the emperor Zeno, to recover Italy from Odoacer. By 493 Ravenna was taken; Odoacer was killed by Theodoric's own hand; and the East-Gothic power was fully established over Italy, Sicily, Dalmatia, and the lands to the north of Italy. In this war the history of the East and West Goths begins again to unite, if we may accept the witness of one writer (Anon. Vales. 728) that Theodoric was helped by West-Gothic auxiliaries. The two branches of the nation were soon brought much more closely together, when, through the overthrow of the West-Gothic kingdom of Toulouse, the power of Theodoric was practically extended over a large part of Gaul and over nearly the whole of Spain. A time of confusion followed the fall of Alaric, and, as that prince was the son-in-law of Theodoric, the East-Gothic king stepped in as the guardian of his grandson Amalaric, and preserved for him all his Spanish and a fragment of his Gaulish dominion. Toulouse passed away to the Frank; but the Goth kept Narbonne and its district, the land of Septimania—the land which, as the last part of Gaul held by the Goths, kept the name of *Gothia* for many ages. While Theodoric lived, the West-Gothic kingdom was practically united to his own dominion. He seems also to have claimed a kind of protectorate over the Teutonic powers generally, and indeed to have practically exercised it, except in the case of the Franks.

The East-Gothic dominion was now again as great in extent, and far more splendid, than it could have been in the time of Ermanaric. But it was now of a wholly different character. The dominion of Theodoric was not a barbarian but a civilized power. His twofold position ran through everything. He was at once national king of the Goths, and successor, though without any imperial titles, of the Roman emperors of the West. The two nations, differing in manners, language, and religion, lived side by side on the soil of Italy; each was ruled according to its own law, by the prince who was, in his two separate characters, the common sovereign of both. The picture of Theodoric's rule is drawn for us in the state papers drawn up in his name and in the names of his successors by his Roman minister Cassiodorus. The Goths seem to have been thick on the ground in northern Italy; in the south they formed little more than garrisons. In Theodoric's theory the Goth was the armed protector of the peaceful Roman; the Gothic king had the toil of government, while the Roman consul had the honour. All the forms of the Roman administration went on, and the Roman polity and Roman culture had great influence on the Goths themselves. The

rule of the prince over two distinct nations in the same land was necessarily despotic; the old Teutonic freedom was necessarily lost. Such a system as that which Theodoric established needed a Theodoric to carry it on. It broke in pieces after his death.

On the death of Theodoric (526) the East and West Goths were again separated. The few instances in which they are found acting together after this time are as scattered and incidental as they were before. Amalaric succeeded to the West-Gothic kingdom in Spain and Septimania. Provence was added to the dominion of the new East-Gothic king Athalaric, the grandson of Theodoric through his daughter Amalasontha. The weakness of the East-Gothic position in Italy now showed itself. The long wars of Justinian's reign (535-555) recovered Italy for the empire, and the Gothic name died out on Italian soil. The chance of forming a national state in Italy by the union of Roman and Teutonic elements, such as those which arose in Gaul, in Spain, and in parts of Italy under Lombard rule, was thus lost. The East-Gothic kingdom was destroyed before Goths and Italians had at all mingled together. The war of course made the distinction stronger; under the kings who were chosen for the purposes of the war national Gothic feeling had revived. The Goths were now again, if not a wandering people, yet an armed host, no longer the protectors but the enemies of the Roman people of Italy. The East-Gothic dominion and the East-Gothic name wholly passed away. The nation had followed Theodoric. It is only once or twice after his expedition that we hear of Goths, or even of Gothic leaders, in the eastern provinces. From the soil of Italy the nation passed away almost without a trace, while the next Teutonic conquerors stamped their name on the two ends of the land, one of which keeps it to this day.

The West-Gothic kingdom lasted much longer, and came much nearer to establishing itself as a national power in the lands which it took in. But the difference of race and faith between the Arian Goths and the Catholic Romans of Gaul and Spain influenced the history of the West-Gothic kingdom for a long time. The Arian Goths ruled over Catholic subjects, and were surrounded by Catholic neighbours. The Franks were Catholics from their first conversion; the Suevi became Catholics much earlier than the Goths. The African conquests of Belisarius gave the Goths of Spain, instead of the Arian Vandals, another Catholic neighbour in the form of the restored Roman power. The Catholics everywhere preferred either Roman, Suevian, or Frankish rule to that of the heretical Goths; even the unconquerable mountaineers of Cantabria seem for a while to have received a Frankish governor. In some other mountain districts the Roman inhabitants long maintained their independence, and in 534 a large part of the south of Spain, including the great cities of Cadiz, Cordova, Seville, and New Carthage, was, with the good will of its Roman inhabitants, reunited to the empire, which kept some points on the coast as late as 624. That is to say, the same work which the empire was carrying on in Italy against the East-Goths was at the same moment carried on in Spain against the West-Goths. But in Italy the whole land was for a while won back, and the Gothic power passed away for ever. In Spain the Gothic power outlived the Roman power, but it outlived it only by itself becoming in some measure Roman. The greatest period of the Gothic power as such was in the reign of Leovigild (567-586). He reunited the Gaulish and Spanish parts of the kingdom which had been parted for a moment; he united the Suevian dominion to his own; he overcame some of the independent districts, and won back part of the recovered Roman province in southern Spain. He further established the power of the crown over the Gothic nobles, who were beginning to grow into territorial lords.

The next reign, that of his son Recared (586-601), was marked by a change which took away the great hindrance which had thus far stood in the way of any national union between Goths and Romans. The king and the greater part of the Gothic people embraced the Catholic faith. A vast degree of influence now fell into the hands of the Catholic bishops; the two nations began to unite; the Goths were gradually Romanized, and the Gothic language began to go out of use. In short, the Romance nation and the Romance speech of Spain began to be formed. The Goths supplied the Teutonic infusion into the Roman mass. The kingdom, however, still remained a Gothic kingdom. "Gothic," not "Roman" or "Spanish," is its formal title; only a single late instance of the use of the formula "*regnum Hispaniæ*" is known. In the first half of the 7th century that name became for the first time geographically applicable by the conquest of the still Roman coast of southern Spain. The empire was then engaged in the great struggle with the Avars and Persians, and now that the Gothic kings were Catholic, the great objection to their rule on the part of the Roman inhabitants was taken away. The Gothic nobility still remained a distinct class, and held, along with the Catholic prelacy, the right of choosing the king. Union with the Catholic Church was accompanied by the introduction of the ecclesiastical ceremony of anointing, a change decidedly favourable to elective rule. The growth of those later ideas which tended again to favour the hereditary doctrine had not time to grow up in Spain before the Mahometan conquest (711). The West-Gothic crown therefore remained elective till the end. The modern Spanish nation is the growth of the long struggle with the Mussulmans; but it has a direct connexion with the West-Gothic kingdom. We see at once that the Goths hold altogether a different place in Spanish memory from that which they hold in Italian memory. In Italy the Goth was but a momentary invader and ruler; the Teutonic element in Italy comes from other sources. In Spain the Goth supplies an important element in the modern nation. And that element has been neither forgotten nor despised. Part of the unconquered region of northern Spain, the land of Asturia, kept for a while the name of Gothia, as did the Gothic possessions in Gaul and in Crim. The name of the people who played so great a part in all southern Europe, and who actually ruled over so large a part of it, has now wholly passed away; but it is in Spain that its historical impress is to be looked for.

Of Gothic literature in the Gothic language we have the Bible of Ulfila, and some other religious writings and fragments (see notice of Gothic Language below). Of Gothic legislation in Latin, we have the edict of Theodoric of the year 500, lately edited by Bluhme in the *Monumenta Germaniæ Historica*; and the books of *Variae* of Cassiodorus may pass as a collection of the state papers of Theodoric and his immediate successors. Among the West-Goths written laws had already been put forth by Euric (466-484). The second Alaric (484-507) put forth a *Breviarium* of Roman law for his Roman subjects; but the great collection of West-Gothic laws dates from the later days of the monarchy, being put forth by King Rekisvinth about 654. This code gave occasion to some well-known comments by Montesquieu and Gibbon, and have been discussed by Savigny (*Geschichte des Römischen Rechts*, ii. 65) and various other writers. They are printed in the old collections of Lindenberg and Heineccius. They do not seem to have been yet reprinted in the *Monumenta Germaniæ*. Of special Gothic histories, besides that of Jordanis, already so often quoted, there is the Gothic history of Isidor, archbishop of Seville, a special source of the history of the West-Gothic kings down to Siunthala (621-631). But all the Latin and Greek writers contemporary with the days of Gothic pre-

dominance make their constant contributions. Not for special facts, but for a general estimate, no writer is more instructive than Salvian of Marseilles in the 5th century, whose work *De Gubernatione Dei* is full of passages contrasting the vices of the Romans with the virtues of the barbarians, especially of the Goths. In all such pictures we must allow a good deal for exaggeration both ways, but there must be a ground-work of truth. The chief virtues which the Catholic presbyter praises in the Arian Goths are their chastity, their piety according to their own creed, their tolerance towards the Catholics under their rule, and their general good treatment of their Roman subjects. He even ventures to hope that such good people may be saved, notwithstanding their heresy. All this must have had some ground-work of truth in the 5th century, but it is not very wonderful if the later West-Goths of Spain had a good deal fallen away from the doubtless somewhat ideal picture of Salvian.

Of modern writers dealing specially with Gothic history may be mentioned Mauso (*Geschichte des Ost-Gothischen Reiches in Italien*, Breslau, 1824); Aschbach (*Geschichte der Westgothen*, Frankfurt, 1827); Kopke (*Die Anfänge des Königthums bei den Gothen*, Berlin, 1854); Dahn (*Die Könige der Germanen*, Munich and Würzburg, 1861-1871); Pallmann (*Geschichte der Völkervwanderung*, Gotha and Weimar, 1863-1864). It is hard to find any work in English dealing specially with Gothic history, though much may be learned from writers like Gibbon and Milman, who deal with the Goths simply as part of some larger subject. Several chapters in the third book of Milman's *History of Latin Christianity* are of special importance in this way. (E. A. F.)

#### GOOTHIC LANGUAGE.

By this name, which may be taken generally as denoting the idioms of the various divisions of the Gothic nation, is more particularly meant the language exhibited in certain fragments of a translation of the Bible and other minor documents, which, although preserved in manuscripts not dating farther back than perhaps the 5th century, and clearly written in Italy during the rule of the East-Goths, are commonly assumed to have originated among the West-Goths at the time when they were seated in Mœsia, and to be therefore older by at least a century than the manuscripts themselves. It is chiefly due to this assumption that the more distinctive name of *Moesogothic language* is often used, in England and elsewhere, as well as the simpler *Gothic*. The latter name, however, seems to be more appropriate, in spite of the great probability of the assumption referred to,—since it is, for obvious reasons, utterly impossible to prove that the language of the West-Goths at that time differed from that of the East-Goths, or, even if there was any difference, to show that our manuscripts represent the original forms of the speech of their supposed West-Gothic author. Indeed, according to a fragment of a Gothic calendar preserved in one of the Milan manuscripts, which gives the name of the Gothic people as *Gut-thiuda*<sup>1</sup> (*thiuda*, "people"), the most correct form of the name would be *Gotic*. This spelling at least has obviously greater claims to authenticity than *Gothi*, *Gotthi*, or *Tórhoi*, and other similar forms most commonly (although not exclusively) used by Latin and Greek writers, whose want of familiarity with the sounds of the Gothic language is often abundantly manifest. From *Gut-thiuda* we may infer with certainty that the Goths called themselves *Gutós*, the corresponding adjective being *gutisks*.

We have no direct evidence of the character of the Gothic language until the time of the above-mentioned manuscripts; but some conclusions regarding a more archaic state of the

language may be drawn from a careful examination of the numerous words borrowed from Gothic at a much earlier period by some of the Finnish tribes originally dwelling in the interior of Russia.<sup>2</sup> It may be safely assumed that some at least of these words still retain forms of the Gothic language from as early a period as perhaps the 1st or 2d century B.C. By the same date the Goths, as well as the other Teutonic nations, were no doubt already in possession of the Runic alphabet, an adaptation of a particular form of the Latin characters to their special wants and uses.<sup>3</sup> No traces of this alphabet, however, have been left, except the already mentioned short inscription of the Bucharest ring, a list of the Gothic names of these runes, preserved in a Vienna manuscript of the 9th century,<sup>4</sup> and some letters in Ulfila's Gothic alphabet, which soon supplanted the less convenient Runic characters, and so helped to inaugurate the short literary period of the Gothic language so closely connected with the name of that prelate.

Ulfila, or rather Vulfila (310-380 A.D., see ULFILA), was a man of the most profound learning. He not only invented, as has been said, a new alphabet for his literary purposes, but was also able to preach and to write in Latin and Greek as well as in his native Gothic language, and he is reported to have left behind him a great number of tracts and translations in these three idioms. The principal work of his life, however, was his translation of the Bible, parts of which seem to have reached us in the famous *Codex Argenteus*, now at Upsala, and in several minor fragments at Wolfenbüttel (*Codex Carolinus*) and Milan (*Codices Ambrosiani*, including some leaves now kept at Rome and Turin). In this way we possess the greater part of the gospels, considerable portions of the epistles, and a few fragments of the Old Testament; there is also a fragment of a commentary on St John's gospel, commonly called *Skeireins* (or "explanation"), and the fragment of a calendar which has been already mentioned as containing the original form of the name of the Gothic people.<sup>5</sup> As to the authorship of the last two fragments nothing can be said with certainty; and certain differences in language and manner of translation make it doubtful even whether the fragments of the Old Testament can be traced to the same origin as those of the New. The bulk of the whole, however, may safely be ascribed to Ulfila, for it can hardly be assumed that the same work would have been done twice over in so short a space of time as that lying between the days of Ulfila and the date of our manuscripts. The whole character of the translation too seems to indicate a man of Ulfila's mental power and theological learning. Although it cannot be denied that several alterations of the original have been introduced into our texts at a later time, it is certain both that the author carefully interpreted the Greek text (which was of course the fundamental source of his work), and also that he consulted, and in not a few places followed, the old Latin versions where his own ideas seemed to differ from those of his Greek authorities.<sup>6</sup>

As a specimen of the language, and of Ulfila's mode of translation, we may insert here his version of the Lord's prayer:—

Atta unsar thu in himinam. Weihnai namo thein. Qimai thiudinassus theins. Wairthai wilja theins swe in himina jah ana

<sup>2</sup> See Dr Wihl. Thomsen, *Ueber den Einfluss der Germanischen Sprachen auf die Finnisch-Lappischen* (Halle, 1870).

<sup>3</sup> See especially Dr Ludv. Wimmer, *Runeskriftens Oprindelse og Udvikling i Norden*, Copenhagen, 1874.

<sup>4</sup> J. Zacher, *Das Gothische Alphabet Vulfilas und das Runen-alphabet*, Leipsic, 1855.

<sup>5</sup> A few Gothic words and names occur among the subscriptions to two Latin charters, one of which is now preserved at Naples; the other, formerly kept at Arezzo, is now lost.

<sup>6</sup> For fuller particulars see the two principal editions of the Gothic texts by V. d. Gabelentz und Loebe (3 vols., Altenburg and Leipsic, 1843-76), and by E. Bernhardt (Halle, 1875).

<sup>1</sup> The same form of the name seems to occur a second time in the Runic inscription of the Bucharest ring, *Gut-annom hailag*, "dedicated to the Goths' treasure." Cf. H. F. Massmann, in Pfeiffer's *Germania* (Vienna, 1857), ii. p. 209 sq.; and Ludv. Wimmer, *Aarbøger for nordisk Oldkyndighed og Historie* (Copenhagen, 1867), p. 45.

airthai. Hlaif unsarana thana sinteinan gif uns himma daga. Jah aflet uns thatei skulans sijaima, swaswe jah weis afletam thaim skulam unsaraim. Jah ni briggais uns in fraistubnjai, ak lausais uns af thamma ubilin.

The Gothic language did not very long survive the times of Ulfla. From Moesia, where it had gained its highest literary culture, it disappeared together with the Goths, when they were driven from these parts by later migrations. In the western portions of Europe, that is, in Italy, France, and Spain, whither it had been carried by the emigrants, the Gothic language seems to have died out even sooner than the Gothic nationality, giving way to the overpowering influence of Latin, and leaving behind it only a few indistinct relics in some proper names and other words that had been received into that victorious language. It was only in a remote spot of the Crimea that it continued to exist until the 16th century, when the last remains of a Gothic people were detected, and a few specimens of their language were gathered by Angerius de Busbeck, a Dutch traveller, who visited the eastern parts of Europe in the years 1554-1564.<sup>1</sup>

It is well known that the literary remains of Gothic are (with the exception, perhaps, of a few Runic inscriptions belonging to the Scandinavian languages) by several centuries the oldest specimens of Teutonic speech, and therefore have a particular value for the student of the history of that family of languages. Notwithstanding this fact, it would be altogether wrong to regard Gothic as the common source of the more modern stages of these idioms. Although very archaic in many of its forms and sounds, it is in these still far removed from the original features of the common language, as that was spoken before any separation of Teutonic tribes had taken place. Most nearly related to it seem to have been the Scandinavian languages, which are now generally assumed to have formed, together with Gothic, the so-called eastern branch<sup>2</sup> of the Teutonic family, while English, Frisian, and Low and High German belonged to a western division. The latter is chiefly marked by the introduction of a considerable number of forms and sounds of a less archaic stamp, while the eastern idioms are found to have adhered more closely to the original forms. Thus, almost the only distinct innovation in the sound-system of the eastern branch is the insertion of a *g* sound into the groups *inu*, *auw*, *uw* in accented syllables, as in Gothic *triggus*, Old Norse *tryggv*, compared with Old High German and Old Saxon *triuwi*, Old English *treowe*, *trywe*, "true"; or Old Norse *höggva*, to hew, Old High German and Old Saxon *haruwan*, Old English *hearwan*. Western Teutonic, on the other hand, is at once discernible by its doubling all single consonants ending a short root-syllable before *y* (*w*, *r*, *l*); thus Old English *theccan*, Old Saxon *thekkan*, Old High German *decken*, to cover (literally "to thatch"), but Gothic *thakjan*, Old Norse *thekja*; or Old English *sellan*, Old Saxon *sellian*, Old High German *sellon*, to sell, but Gothic *saljan*, Old Norse *selja*. As to the inflexional system, the accusative plural of nouns has in Western Teutonic been replaced by the nominative form, as in Old English *dagas*, Old Saxon *dagōs*, Old High German *tagā*, days; Gothic still has *dagōs* for the nominative, and *dagans* for the accusative, the Old Norse forms being *dagar* and *daga* respectively. The same change is found in the adjectives, as Old English and Old Saxon *blind*, Old High German *blinde*, blind (*cævi*), corresponding to both Gothic *blindai* and *blindans*, Old Norse *blindir* and *blinda*. On the other hand, the formation of the plural of certain neutral substantives by adding an *r*, as in Old English *lombur*, lambs, Old High German *lombir* (still extant in the English plural *children*) is entirely lost in Eastern Teutonic (Gothic *lamba*, Old Norse *lamb*). Another instance of change is to be seen in the loss of the dative case of the reflexive pronoun (Gothic *sis*, Old Norse *sér*) in Western Teutonic, the corresponding forms of the personal pronoun of the 3d person being used instead (Old English *him*, *hire*, &c.) Western Teutonic has also introduced the use of the genitive forms of the same personal pronoun instead of the possessive pronoun (Gothic *seins*, Old Norse *stinn*) when the possessor is denoted by a feminine or a plural (Old English has gone even farther by dropping the possessive pronoun altogether). In the verb, Western Teutonic has replaced the original form of the 2d person singular of the past indicative

ending in *-t* (as in Gothic and Old Norse *wast*, *gaft*, thou wert, gavest) by the corresponding form of the subjunctive (Old English *wære*, *gedæfe*, Old Saxon and Old High German *wāri*, *gābi*). Western Teutonic has also lost the faculty of deriving passive or intransitive verbs from active verbs or adjectives by adding the syllable *-na-* after the root-syllable, as in Gothic *fullnan*, Old Norse *fullna*, to be filled, as compared with Gothic *fulls*, Old Norse *fullr*, full; or Gothic *fulljan*, Old Norse *fulla*, to fill. Only a very few instances of this formation are left in Western Teutonic, such as Old English *wæccan*, to awaken [intrans.], or *leornian*, German *lernen*, to learn (cf. Old English *weccan*, German *wecken*, to awaken [trans.], and German *lehren*, to teach). As to the vocabulary, we may mention the loss of the verb *dōn*, to do, in Gothic and Scandinavian. The most conspicuous peculiarity in the syntax is the frequent use of the dative (or perhaps originally the instrumental case) instead of the accusative in Eastern Teutonic.

Among the Teutonic languages Gothic holds by far the foremost rank as regards the regularity of its sound-system and its inflexions. The vowel system is remarkable for the absence of the short *e* and *o* sounds, except in a few places where *ē* and *ō* (spelt *ai* and *au*) occur under certain consonantal influences. *Umlaut*, or assimilation of root-vowels to a following *a-*, *i-*, or *u-* sound, is not discernible in Gothic. Thus we find only five short vowels, *a*, (*ai*), *i*, (*au*), *u*; five long vowels *ā*, *ē*, *ī* (spelt *ei*), *ō*, *ū*; and three diphthongs *ai*, *au*, and *iū*. There may have been other distinctions of vowel-qualities besides those expressed in spelling, but we have no means of definitely settling this question; so much, however, can be said, that the long vowels, and especially *ē* and *ō*, probably had the close sounds, since these are often interchanged with *ei* and *u* in our manuscripts. The spelling of the consonantal system is also very simple. Besides *y*, *w*, *r*, *l* and three nasal sounds (the guttural nasal being expressed by *g* after the Greek fashion), we find three voiceless stops, *p*, *t*, *k* (*g* being only a combination of *kw*); three voiced stops, *b*, *d*, *g*; four voiceless spirants, *f*, *s*, *th*, *h*; and only one distinct sign for a voiced spirant, *z*. This system of spelling, however, is obviously insufficient to express all the sounds of the language,—an insufficiency partly due to the fact that the transcription of the Gothic speech-sounds was chiefly an imitation of the Greek alphabetic system, which, at least in Ulfla's time, had become rather imperfect, inasmuch as different sounds developed out of one sound of an earlier period were still often expressed by the same sign (just as in the English orthography of the present day). It is highly probable, for instance, that the signs of *b*, *d*, *g* of the Gothic alphabet not only expressed the sounds of voiced stop consonants (*medios*), but also represented the sounds of voiced spirants, such as English *v* and soft *th*, or North German *g* after a vowel (these values being the only ones left to the Modern Greek signs *β*, *γ*, *δ*). Hence the regular change of *b*, *d* final after a vowel into *f*, *th*, as in *gaf*, I gave, from *giban*, to give; or *bath*, I bade, from *bidjan*, to bid.<sup>3</sup>

Great regularity prevails also in the inflexional system. In the substantival and adjectival declensions the instrumental case has become extinct by an early confusion with the dative (the case commonly called dative being, in fact, a mixture of forms of the original dative and the instrumental and local cases), while in the Western branch of Teutonic it was still in frequent use. At the same time, Gothic is the only Teutonic idiom that has still preserved, in a few cases, the vocative in a form distinct from that of the nominative (*fisks*, fish, for instance, has *fisk* in the voc.). The adjectival declension is remarkable for the retention of special forms of the *i-* and *u-* stems, which in all other Teutonic languages have been transferred to the inflexion of the *ja-* stems. In the pronominal inflexion the instrumental case has been kept distinct in a few instances, such as *thē*, *hwē* (the latter form being the same as English *why*). There are also some relics of the dual number left in the 1st and 2d personal pronouns. As for the verb, Gothic is quite unique in retaining the old formation of the passive voice by means of simple derivation (as in *bairada*, *bairanda*, he is, they are borne, Greek *φέρεται*, *φέρονται*), the dual number of the 1st and 2d persons throughout the whole active voice (*bairōs*, *bairats*, we, you two bear, in the indicative, or *bairaiwa*, *bairaits* in the subjunctive, or *bairu*, *bairuts*, we, you two bore [ind.], and *bairiwa*, *bairiuts* [subj.] along with the plural forms *bairam*, *bairiuh*, &c.), and the 3d person of the imperative (as *bairadaw*, *bairandaw*, he, they shall bear, Greek *φέρτω*, *φέρντων*). The different verbal classes are of course the same as in the other cognate idioms; but they are kept more completely distinct in Gothic, for it is only there that the reduplication has been preserved intact in the past of the reduplicative verbs, Gothic *haihald*, I held, for instance, corresponding to such shortened forms as Old Norse *helt*, Old English *heold*, Old Saxon *held*, and Old High German *hēlt*, *healt*, *hielt*. Gothic again is the only language that seems to give us a clue to the explanation of the formation of the past in weak verbs. There we find such

<sup>1</sup> See his report and word-lists, reprinted by Massmann, in *Zeitschrift für Deutsches Alterthum*, i. p. 345 seq. The words contained in these lists are not all intelligible, and some of them are clearly of Slavonic or Iranian origin, but others are decidedly Gothic as regards their form, thus *schlipen*, to sleep; *criten*, to weep; *fyder*, four; the correct Gothic forms being *slēpan*, *grētan*, *fidvōr*.

<sup>2</sup> H. Zimmer, "Ostgermanen und Westgermanen," in *Zeitschrift für Deutsches Alterthum*, xix. p. 393 sq.

<sup>3</sup> See W. Weingaertner, *Die Aussprache des Gothischen* (Leipzig, 1658); F. Dietrich, *Ueber die Aussprache des Gothischen* (Marburg, 1862); H. Paul, "Zur Lautverschiebung," in *Beiträge zur Geschichte der Deutschen Sprache und Literatur*, i. 147 sq. (Halle, 1874).

plural forms as *hauri-dēdum*, we heard, while in Old Norse we have simple *heyr-ðum*, in Old English *hier-don*, &c. Now, this *-dēdum* would be exactly the corresponding form of the verb *dōn*, to do (lost in Gothic, as mentioned above), so that *hauri-dēdum* must once have meant "we did hear."

Notwithstanding all these instances of great antiquity we must be on our guard against the assumption that Gothic in all its features bears the same archaic stamp. In fact, it often goes farther than the other cognate idioms in dropping short final vowels. There are no traces left of the short vowels originally ending *a-* or *i-* stems in declension; thus, *dags* from *daga-*, day; *haurn* from *horn-*, horn; *gasts* from *gasti-*, guest; *hugs* from *hugi-*, mind; but there are many instances of the preservation of these vowels in the other languages, such as *dagar*, *horn*, *gasti* in Old Scandinavian Runic inscriptions, or *hyge* in Old English, or *hugi* in Old Saxon and Old High German.<sup>1</sup> Even the regularity of the inflexional system is often not archaic, but due to later assimilations of forms originally more distant than in Gothic. The most striking instance of this is perhaps the loss, in the verbal system, of the so-called grammatical change, that is, the transferring of a voiceless spirant into a voiced spirant after a syllable unaccented in the earliest time before the general Teutonic rule of fixing the accent on the root-syllables had come into use.<sup>2</sup> This change (still discernible in such English forms as *I was*, *we were*) was fully developed in all other cognate idioms, as for instance in Old English, cf. *ic was*, *we wæron*, or *ceosan*, to choose, *ic ceas*, *we curon*, *gecoren*, &c., these forms standing for *was*, *wæzum*, &c. Gothic has given up the voiced sound altogether, forming simply *was*, *wesum*, or *kusans*, *kauris*, *kusum*, *gaksans*. It is only in some isolated words (such as *fadar* and *brōthar*, corresponding to Sanskrit *pitar* and *bhrātār*), and some derivatives that even traces of this fundamental rule are now to be found in the Gothic language. (E. SL.)

**GOTTFRIED.** Meister Gottfried of Strasburg, the most brilliant German poet of the Middle Ages, flourished about the end of the 12th and beginning of the 13th century. Of his life and position we have no certain information, for he has told us next to nothing about himself, and contemporary records are dubious and confusing. It would seem, however, that he was a man of good birth and position, who filled an important municipal office in his native town of Strasburg. His chief work was written about 1210, and we may confidently place his death between 1210 and 1220. We know from his writings that he was a man of high culture, but it is almost certain that he was not a priest. Of this his occasional sneers at the clergy are perhaps a better proof than the dubious morality of much of his work. Gottfried wrote one great poem, *Tristan und Isolte*. The story is of Celtic origin; it came first from Britain and Ireland, thence was carried to France, and thence to Germany. Few stories have been so often treated or have had so wide an influence upon literature. A very few words will suffice to give Gottfried's version of it. King Mark of Cornwall has a nephew named Tristan, whom he sends to woo vicariously, and bring home as queen of Cornwall, the beautiful Isolte, princess of Ireland. The young man goes on his mission, is successful, and sets out with Isolte on the homeward journey. Before they reach Cornwall, however, they unfortunately drink a love potion which Isolte's mother had intended to be given to her daughter by the king of Cornwall. The consequence of the mistake is that the young people fall madly and hopelessly in love with one another. The wild force of their passion soon causes them to disregard morality and prudence alike, and the bulk of the poem is devoted to an account of the numerous complications which in time arose. Of course the king soon becomes suspicious, and at last his suspicions become certainties. Tristan withdraws to Normandy, and enters into an alliance with a princess of the land, whose very name—Isolte, the white-handed—has a strange charm for him. But he finds that he really cares

nothing for this new Isolte; the memory of his old love rises powerfully in his soul; and he gives utterances to his doubts and perplexities in a soliloquy, with which the poem abruptly concludes.

*Tristan* is thus an unfinished work; still it is a tolerably long one, as it consists of 19,552 short rhymed lines. The style is highly finished. There is an artistic choice of fit words, a frequent use of antithesis and word-play, and a skilful management of the versification. But these are, of course, only side matters. The permanent interest of the poem consists in its representation of human passion, and in the knowledge it shows of the human heart. The plain, rude story, when told by Gottfried, takes a depth and pathos that are hardly its own. All is described, too, with such clear, bright touches, and such vivid force, that the poem seems somehow a tale of our own time. Its morality indeed is not high; but this objection did not probably occur to those who first read it. If we judge it by a purely art standard, we must pronounce it worthy of an important place in the literature of Europe. *Tristan* was not allowed to remain a fragment. Ulrich von Türheim (about 1236) and Heinrich von Freiberg (about 1270) both wrote continuations and conclusions of the work, which certainly fell far short of the original.

Of Gottfried's other writings, only some lyrics in the ordinary style of the minnesingers remain to us. Two longer poems, entitled *Lobgesang auf die Jungfrau Maria* and *Gedicht von der Armuth*, were long attributed to him, but recent criticism has conclusively proved that they are the work of others. Gottfried's influence on German literature was very great, and a proof of this is the number of poets who treated the same subject after the plan he had laid down. All these, from Hans Sachs (1494–1576) to Immermann (1796–1840), may fairly be claimed as his followers.

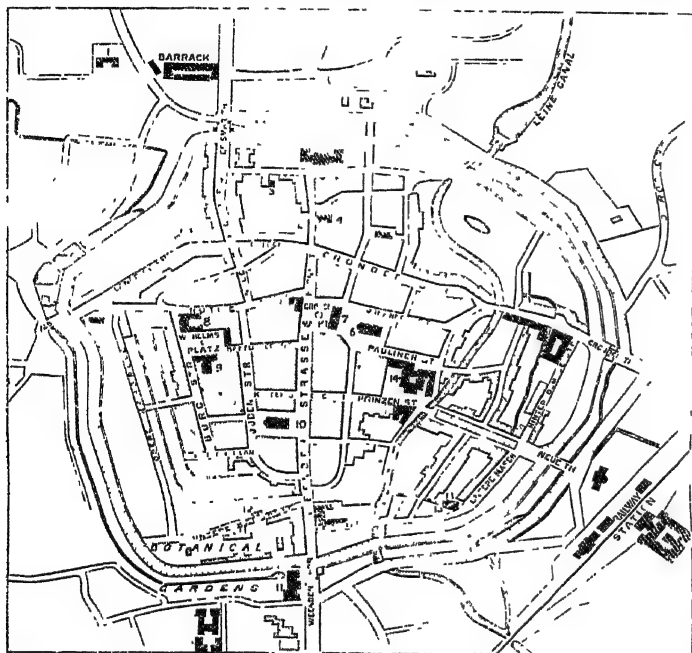

The chief editions of Gottfried's *Tristan* are those of Fr. Heinrich v. d. Hagen (a complete edition, with the continuations, Bresl., 1823), Groote (Berlin, 1821), Massmann (Leip., 1843), and Bechstein (containing a very able and complete introduction, 2d ed., 2 vols., Leip., 1873). See also the translations into modern German, with continuations, &c., by Herm. Kurz (Stuttg., 1844, 3d ed., 1877), and Karl Simrock (2d ed., Leip., 1875). For what is known of the life of Gottfried see Kurz's "Zum Leben Gottfried von Strassburg" (in the *Augsburg. Allgemeine Zeitung* for 1868, and *Germania*, 15 Jahrgang); and as to the sources of the story, Franck's *Tristan et Isolte* (Paris, 1865), and F. Compert, *Die Sagenüberlieferungen in den Tristan-Epen Eilhart von Oberg und Gottfried von Strassburg* (Gustrow, 1876).

**GÖTTINGEN**, the chief town of a circle of the same name in the land-drostei of Hildesheim and province of Hanover, Prussia, is pleasantly situated at the foot of the Hainberg in the fertile valley of the Leine, about 67 miles to the south of Hanover, on the Hanover and Cassel railway. It is traversed by the Leine, which separates the Altstadt from the Neustadt and Masch; and it is surrounded by ramparts which are planted with lime trees and form an agreeable promenade. The streets in the older part of the town are for the most part crooked and narrow, but the newer portions are spacious and regularly built. Apart from the churches and the numerous university buildings, it has few structures of any public importance. There are several thriving industries, including, besides the various branches of the publishing trade, the manufacture of woollen and cotton goods, and of physical and mathematical instruments. The university, the famous Georgia Augusta, founded by George II. in 1734, and opened in 1737, rapidly attained a leading position, and in the year 1823 its students numbered 1547. Political disturbances, in which both professors and students were implicated, lowered the attendance to 860 in 1834; and the expulsion of the famous seven professors (Albrecht, Dahlmann, Ewald, Gervinus, Weber, and the brothers Grimm) in 1837 still

<sup>1</sup> E. Sievers, in *Beiträge zur Geschichte der Deutschen Sprache und Literatur*, v. 101 sq. (Halle, 1878).

further reduced its prosperity. The events of 1848, on the other hand, told somewhat in its favour; and since the annexation of Hanover in 1866 it has been carefully cherished by the Prussian Government. In the winter session 1877-78, its students numbered 909, and the teaching staff 124,—its numerical strength thus entitling it to rank as the eighth on the list of German universities. The present professoriate includes, among other distinguished names, those of Benfey, Lagarde, Lotze, Ritschl, and Weber. Amongst those who have been teachers within its walls may be mentioned, besides the seven already named, Haller, Gesner, Gatterer, Sprengel, Heyne, Blumenbach, Herbart, Heeren, O. Müller, K. F. Hermann, and Eichhorn.

Plan of Göttingen.

Neander, Ewald, and the distinguished chemist Bunsen, it may be added, were natives of Göttingen. The university library contains upwards of 500,000 printed volumes and 5000 manuscripts. There is a good chemical laboratory, as well as adequate zoological, ethnographical, and mineralogical collections, the most remarkable being Blumenbach's famous collection of skulls. The other establishments more or less connected with the university, such as the observatory, botanical garden, and various hospitals, do not call for special notice. The Gesellschaft der Wissenschaften publishes the long-established and well known *Göttingische Gelehrte Anzeigen*. The population in 1875 numbered 17,057.

The earliest mention of a village of Goding or Gutingi occurs in documents of about 950 A.D. The place received municipal rights from the emperor Otho IV. about 1210, and from 1286 to 1463 it was the seat of the princely house of Braunschweig-Göttingen. During this period it held a high place among the towns of the Hanseatic League. In 1531 it joined the Reformation movement, and in the following century it suffered considerably by the Thirty Years' War, having been taken by Tilly in 1626, after a siege of 25 days, and recaptured by the Swedes in 1632. After a century of decay, it was anew brought into importance by the establishment of its university; and a marked increase in its industrial and commercial prosperity has again taken place in recent years.

See Schmidt, *Urkundenbuch der Stadt Göttingen 1400-1500* (1867); Pütter, *Versuch einer akademischen Gelehrten-geschichte der Universität Göttingen* (1765-88), continued by Saalfeld (1820) and by Oesterley (1838); Unger, *Göttingen und die Georgia Augusta*, 1872.

GOTTSCHALK, or GOTESCHALCUS, surnamed FULGENTIUS, a prominent figure in one of the most important theological controversies of the 9th century, was the son of Berno, a Saxon count, and, having been devoted (oblat) from infancy by his parents to the monastic life, was trained at the monastery of Fulda, during the abbacy of Hrabanus Maurus, and while Walafrius Strabus was a member of the fraternity. At the approach of manhood he made strenuous efforts to be released from his vows; and he actually succeeded in obtaining from a synod held at Mainz in 829 the necessary dispensation; but through the hostile influence of his abbot this was afterwards cancelled by Louis the Pious, though as a slight mitigation of the harshness of this treatment he was permitted to remove to the monastery of Orbais, in the diocese of Soissons. Here he devoted himself to ardent study of the writings of Augustine, with the result that he became an enthusiastic believer in the doctrine of absolute predestination, in one point going even beyond his master—Gottschalk believing in a predestination to condemnation as well as in a predestination to salvation, while Augustine had contented himself with a doctrine of preterition as complementary to his doctrine of election. While returning from a pilgrimage to Rome in the year 847, Gottschalk, happening to pass a night at a hospice in Friuli, came into contact with Notting, the newly elected bishop of Verona, and expounded to him his peculiar views. The bishop, apparently without saying much at the time, carried word to Hrabanus Maurus, who, meanwhile, had become archbishop of Mainz; the latter lost no time in issuing two letters, one to his informant and another to Count Eberhard of Friuli, in both which he denounced the opinions of Gottschalk with some recklessness and great violence. On the one hand, he accused his adversary of neglecting the distinction between foreknowledge and foreordination; on the other hand, he himself refused to recognize any difference between predestination to punishment and predestination to sin. At a synod held in Mainz in presence of the emperor in 848, Gottschalk presented himself with a written explanation and defence of his views; he was, however, very summarily found guilty of heresy, and handed over to his ecclesiastical superior, Hincmar of Rheims, to be dealt with as his crime might deserve. Having again assumed the defensive in an assembly at Chiersy in 849, he was once more condemned,—on this occasion not only as a heretic, but also as a despiser of authority, and as a disturber of the church's peace,—and sentenced to be whipped severely and rigorously imprisoned (*durissimis verberibus castigari et secundum ecclesiasticas regulas ergastulo retrudi*). The place selected for his captivity was the monastery of Hautvilliers in the diocese of Rheims, and here he languished throughout the remainder of his life, a period of twenty years, notwithstanding the efforts of influential friends and his own pitiful appeals. Prudentius of Troyes, Wenilo of Sens, and Florus of Lyons successively expressed opinions more or less in favour of his views; nor did Hincmar derive much real aid from the dialectical skill of Erigena, whom he had called in as an authority on the other side. Various synods met, reached widely discrepant opinions on the burning question, and ultimately postponed its settlement to a future council in less troubled times. The summons of Pope Nicholas I., in 863, calling Hincmar to account for his harsh conduct, unfortunately never took effect; and the result was that, after many renewed attempts at conviction and persuasion on the part of Gottschalk—he even proposed to settle the question by ordeal of fire—he was suffered to die unheeded in 868, and, by orders of his inhuman adversary, was buried in unconsecrated ground. It may be added that Gottschalk had attempted to establish a counter charge of heresy against Hincmar, on account of the latter's substitution

of "Sancta Deitas" for "Trina Deitas" in a current hymn. This was thought to savour of Sabellianism; but the orthodox archbishop succeeded at once in purging himself from such an imputation of heretical pravity.

The story of Gottschalk has been told with great fulness by Neander and Gieseler. See also Gfrörer's *Untersuchung über Alter, Ursprung, und Zweck der Dekretalen des falschen Isidorus*, 1848.

GOTTSCHED, JOHANN CHRISTOPH (1700–1766), a German author and critic of considerable influence in his own time, was born, 2d February 1700, at Judithenkirch, near Königsberg. He studied philosophy and literature at Königsberg, was appointed professor, first of poetry (1730), afterwards of logic and metaphysics (1734), at Leipsic, filled various other important offices in connexion with the university, and died 12th December 1766. His chief works were a tragedy entitled *Der sterbende Cato* (Leipsic, 1732)—poor enough rubbish, though it had great but short-lived popularity; *Deutsche Schaubühne* (1740–45), a collection of plays, some of which were written by himself, his wife, J. C. Schlegel, and their friends, whilst others were translated from the French classical dramatists; *Nöthiger Vorrath zur Gesichte der deutschen dramatischen Dichtkunst* (1757–1765), intended to contain an account of all previous German plays. Though not complete, the last is a very valuable and important work. Besides these, Gottsched wrote a number of educational works, and edited several journals devoted to literary criticism. He was a pedant, but there is no doubt that he did good and lasting service to German literature. When he began to write, the stage was occupied by plays in which extravagant rant did duty for eloquence, coarse vulgarity for wit, and the wildest improbabilities for inventive incident. In the writings of the second Silesian school the utmost extent of absurdity was reached. Gottsched set his face against such productions. He enunciated rules by which the playwright must be bound; he insisted on the observance of the dramatic unities, and pointed to the French drama as the best possible model for the German stage; moreover,

his criticism did much to regulate and purify the German language. Unfortunately he went too far. He placed himself in opposition to the Swiss writers Bodmer and Breitinger, who were bringing before the German public several of the great English writers, more especially Milton; he refused to recognize the rising genius of Klopstock and Lessing, and still went on enunciating rules when the time for that was past, and praising mediocre writers as if they had been great geniuses. So it came to pass that his influence speedily declined, and that before his death his name became almost proverbial for pedantic folly. Of all lots his was the hardest, for he outlived his own reputation. His wife, Luise Adelgunde Victorie Kulmus (1713–1762), was his faithful helper in his literary labours, and herself an authoress of reputation. Among other works she translated the *Spectator* (9 vols., 1739–43) and Pope's *Rape of the Lock* (1744, new ed. 1772). After her death her husband edited her *Gedichte*, with a memoir (1763). See Danzel's *Gottsched und seine Zeit*, Leipsic, 1848.

GÖTZ, JOHANN NIKOLAUS (1721–1781), a minor German poet, born at Worms, 9th July 1721, studied theology at Halle (1739–1742), where he became intimate with Gleim and Uz, acted for some years as military chaplain, and afterwards filled various other ecclesiastical offices. He died at Winterberg, 4th November 1781. The writings of Götz consist of a number of short lyrics and several translations, of which the best is a rendering of Anacreon. His original compositions are light, lively, and sparkling, and are animated rather by French wit than by German depth of sentiment. They give easy expression to some unexpected whim or conceit, and, though utterly destitute of depth or force, are yet very pretty specimens of elegant trifling. Of that sort of work it would be difficult to find more favourable examples than *Thamire an die Rosen* and *An eine Romansleserin*. See Götz's collected works, with biography by Ramler (Mannheim, 1785, new ed., 1807); also J. H. Voss, *Briefe über Götz und Ramler* (Mannheim, 1809).
